Plan

- Domain-Specific Languages (DSLs)
 - Languages and abstraction gap
 - Examples and rationale
 - DSLs vs General purpose languages, taxonomy
- External DSLs
 - Grammar and parsing
 - Xtext
- DSLs, DSMLs, and (meta-)modeling

Contract

- Better understanding/source of inspiration of software languages and DSLs
 - Revisit of history and existing languages
- Foundations and practice of Xtext
 - State-of-the-art language workbench (Most Innovative Eclipse Project in 2010, mature and used in a variety of industries)
- Models and Languages
 - Perhaps a more concrete way to see models, metamodels and MDE (IDM in french)

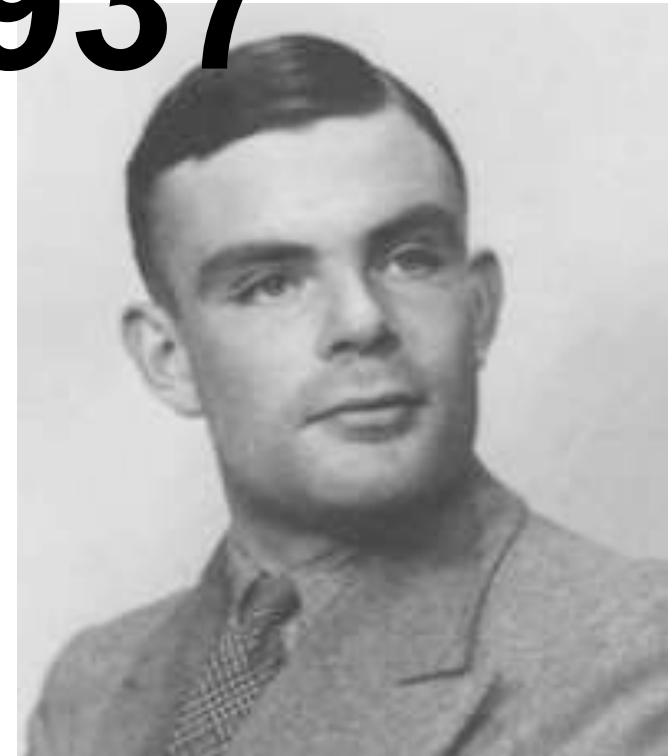

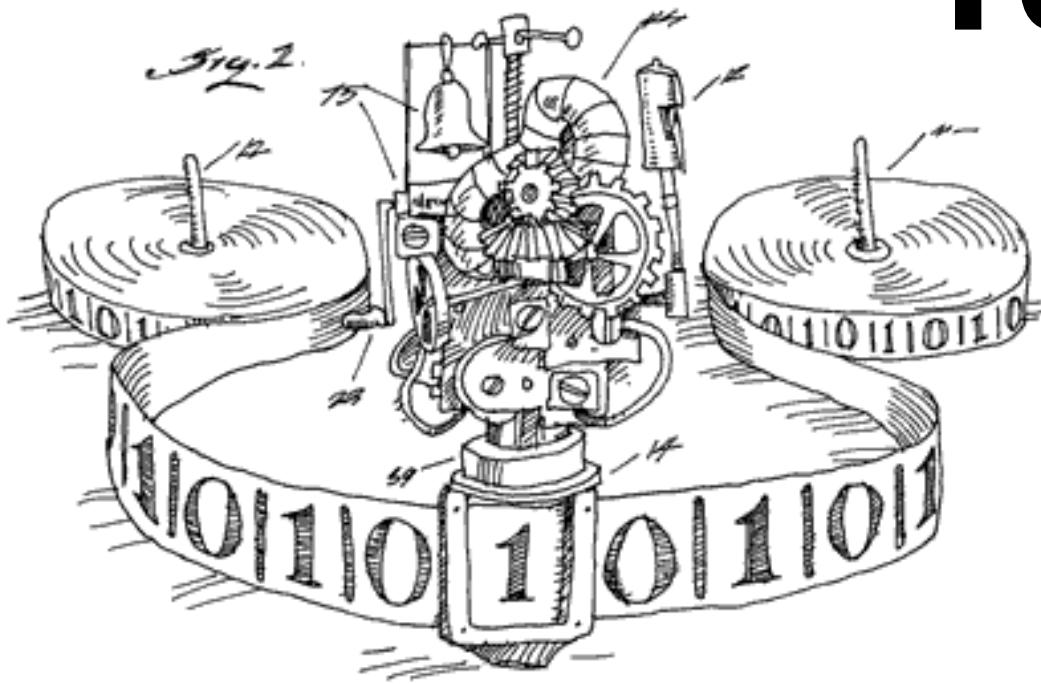

What are DSLs

Where are DSLs

Why DSLs (will) matter

The (Hi)Story of Software Engineering / Computer Science

1937

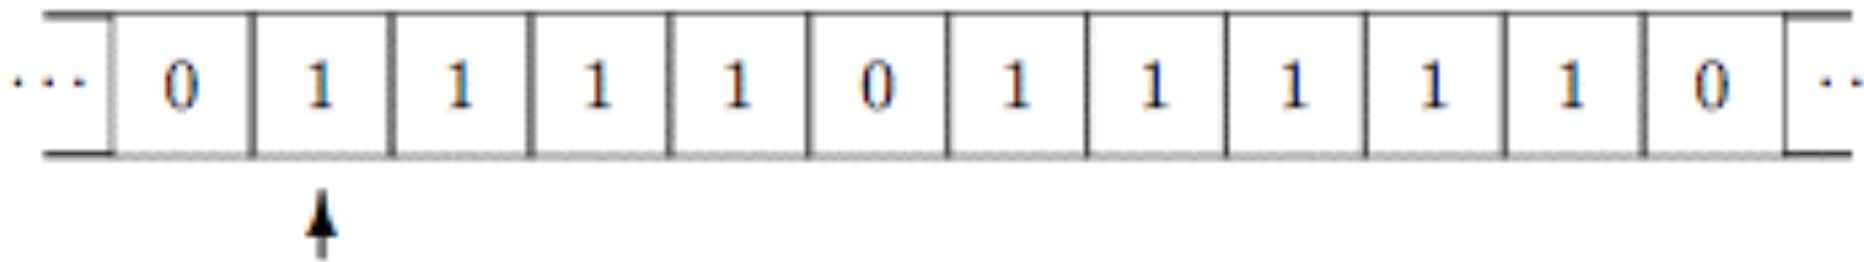

Turing Machine

- Infinite tape divided into Cells (0 or 1)
- Read-Write Head
- Transition rules

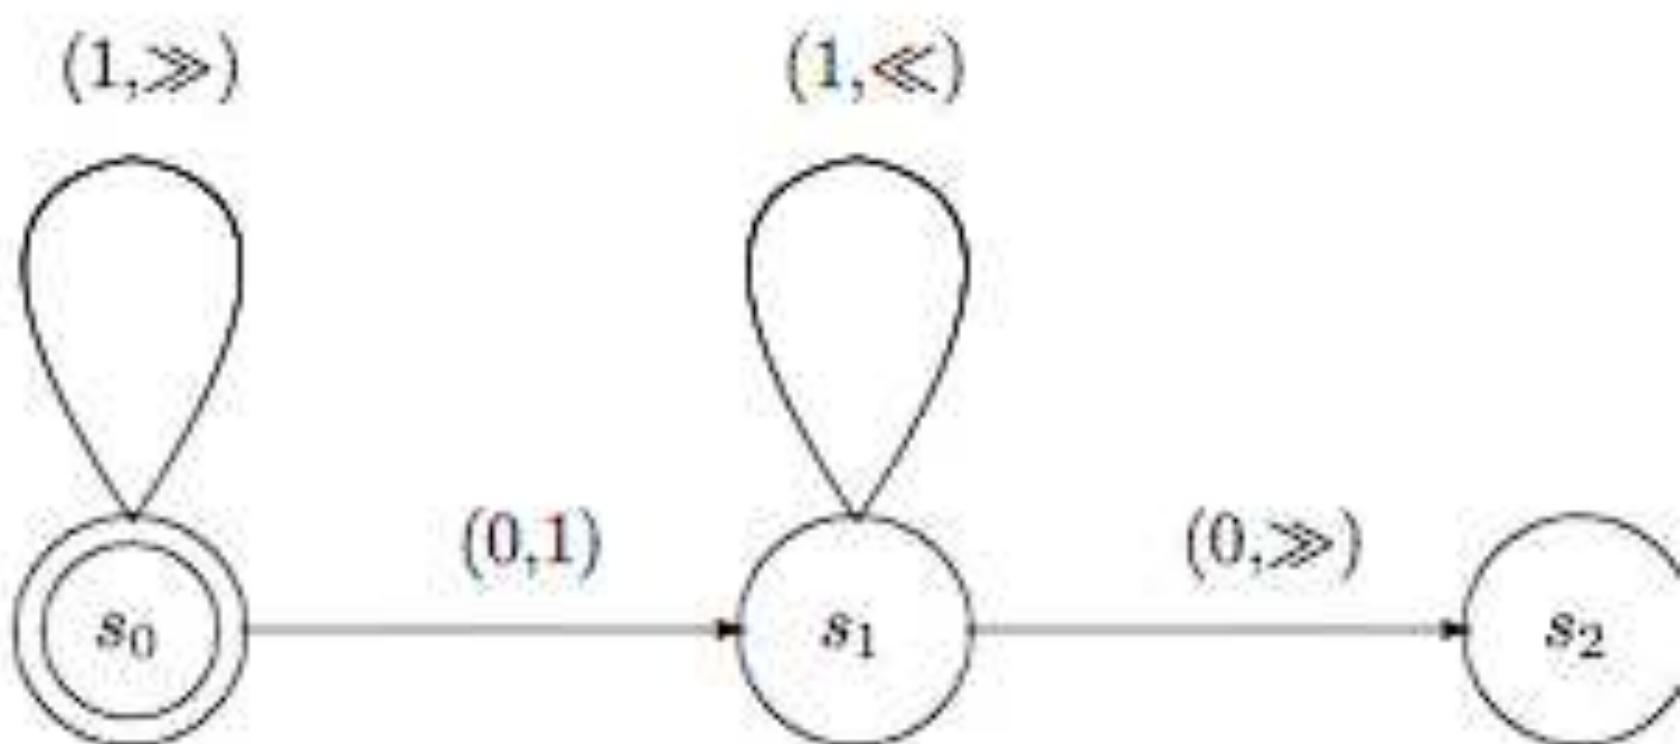

**Write a symbol
or move to left (>>) or right
(<<)**

< State_{current}, Symbol, State_{next}, Action >

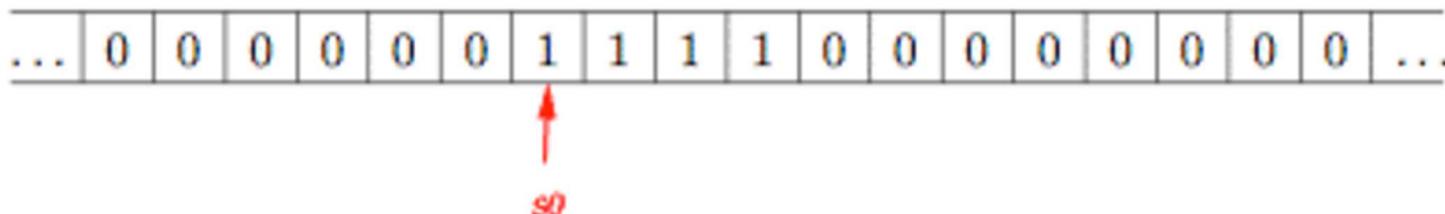

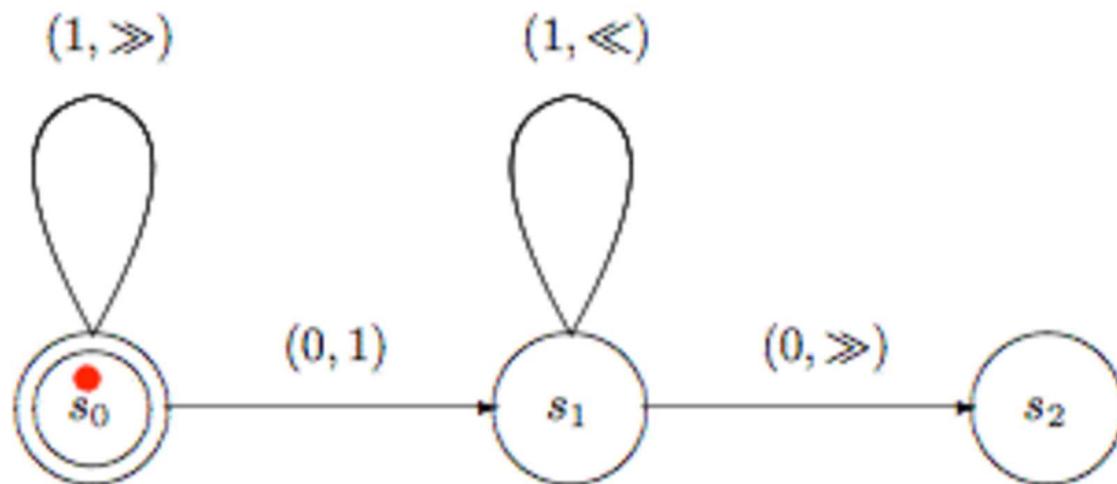

Turing Machine

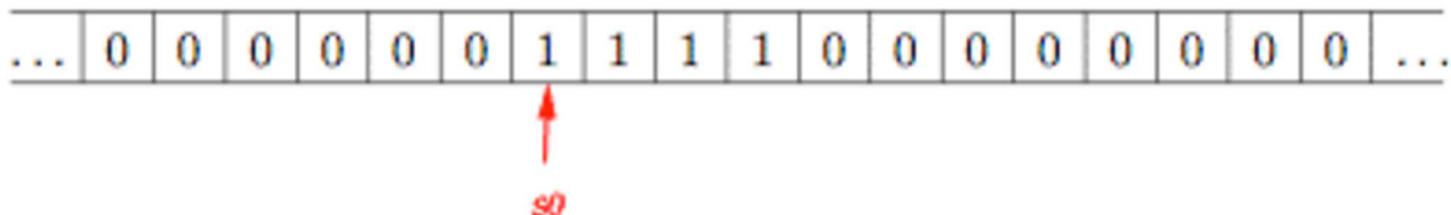

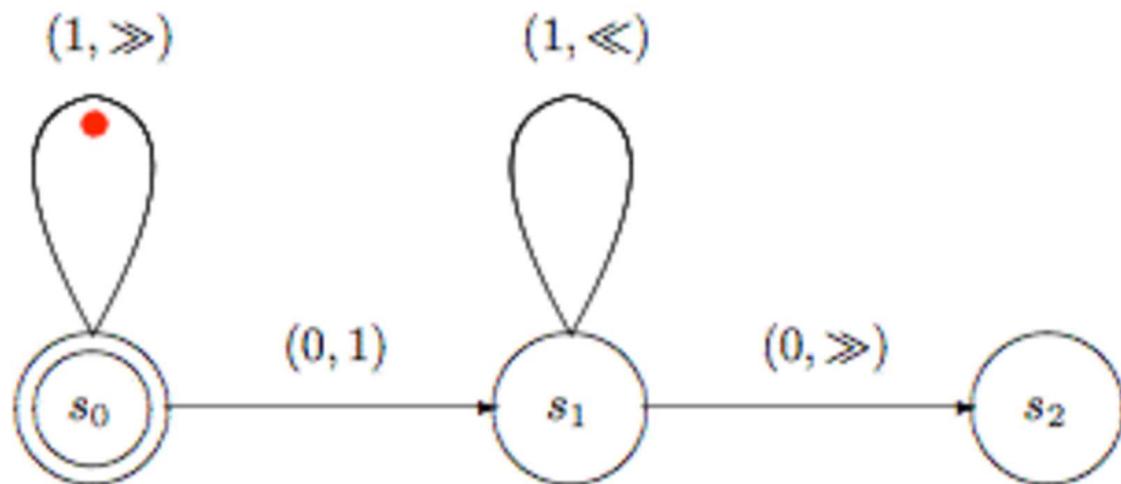

~ kind of state machine

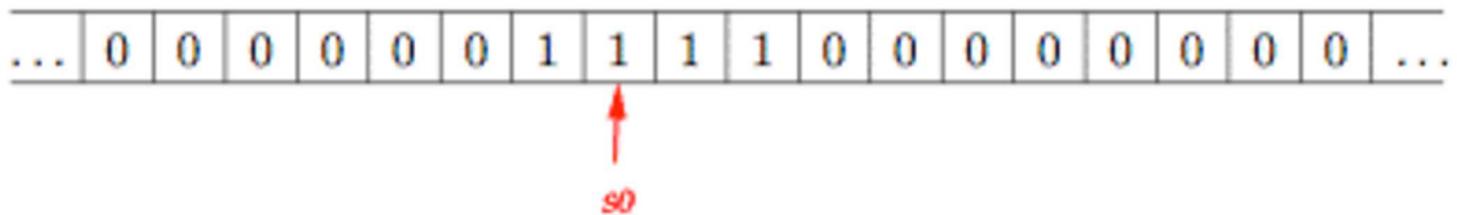

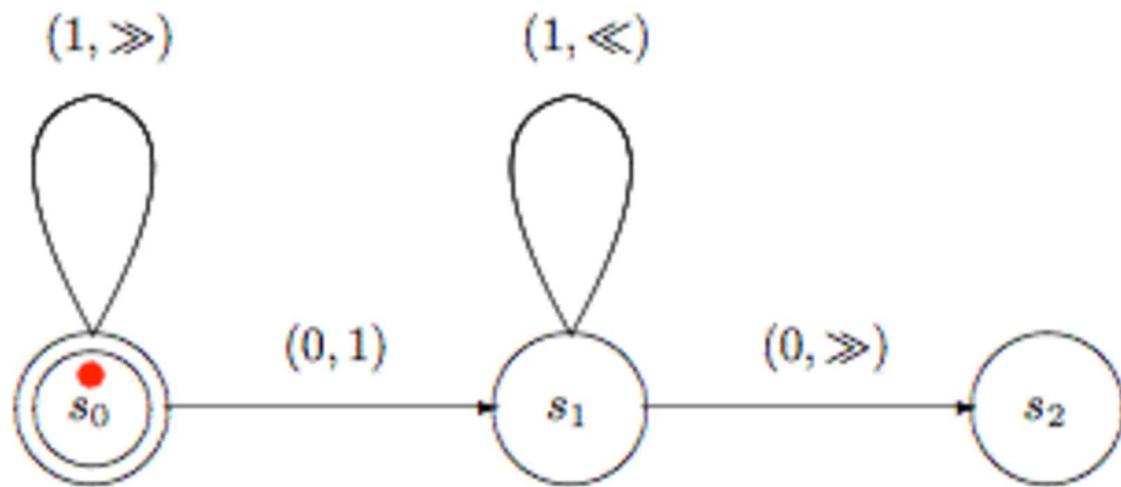

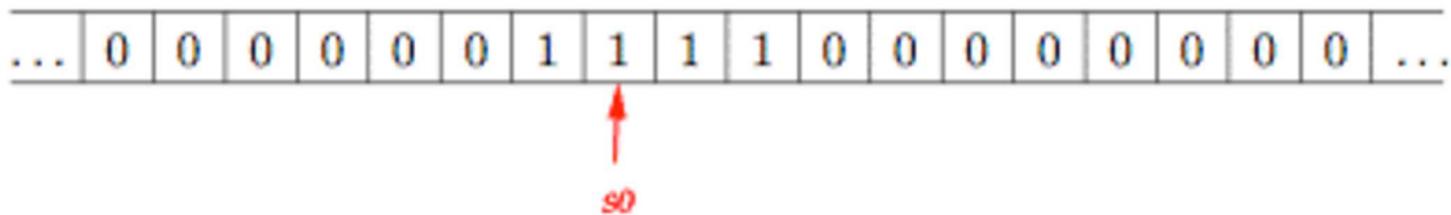

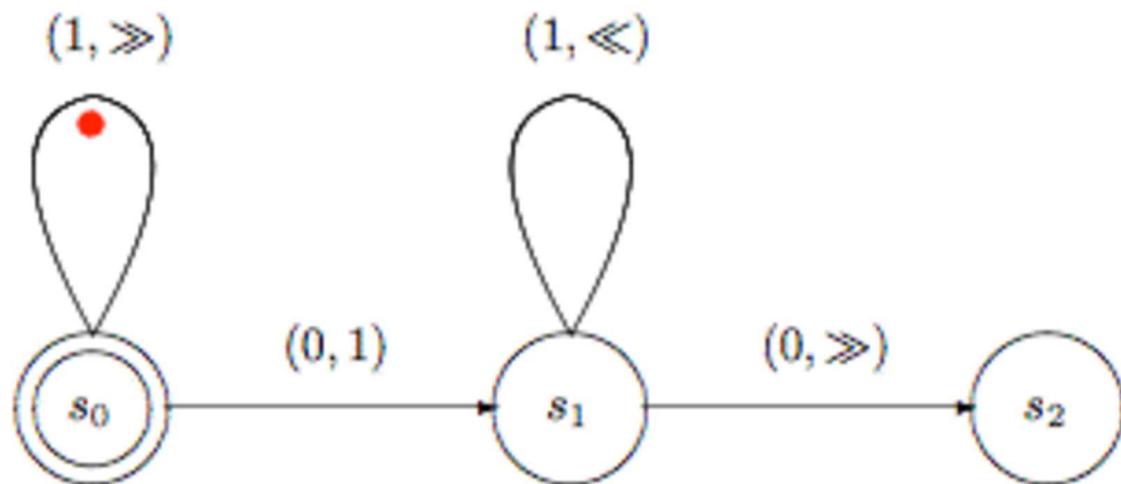

Successor (add-one) function

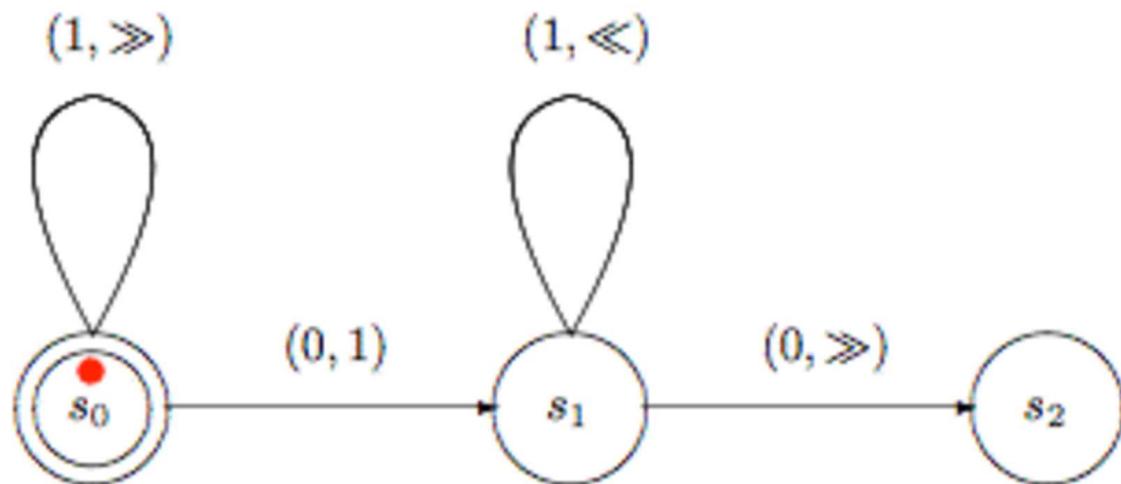

assuming that number n as a block of $n+1$ copies of the symbol '1' on the tape (here, $n=3$)

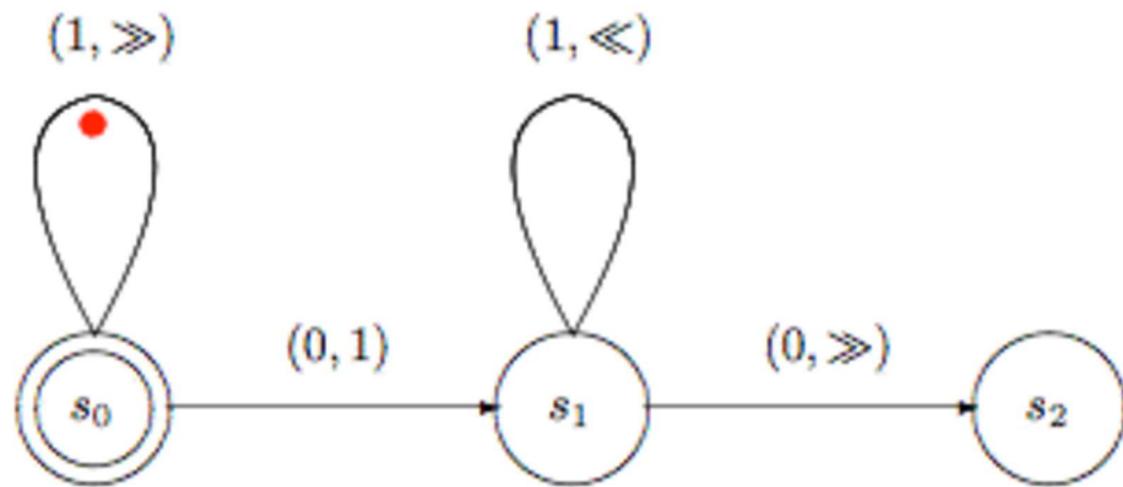

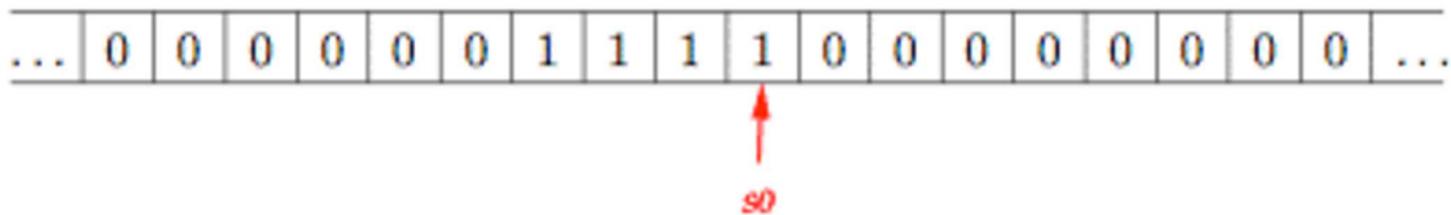

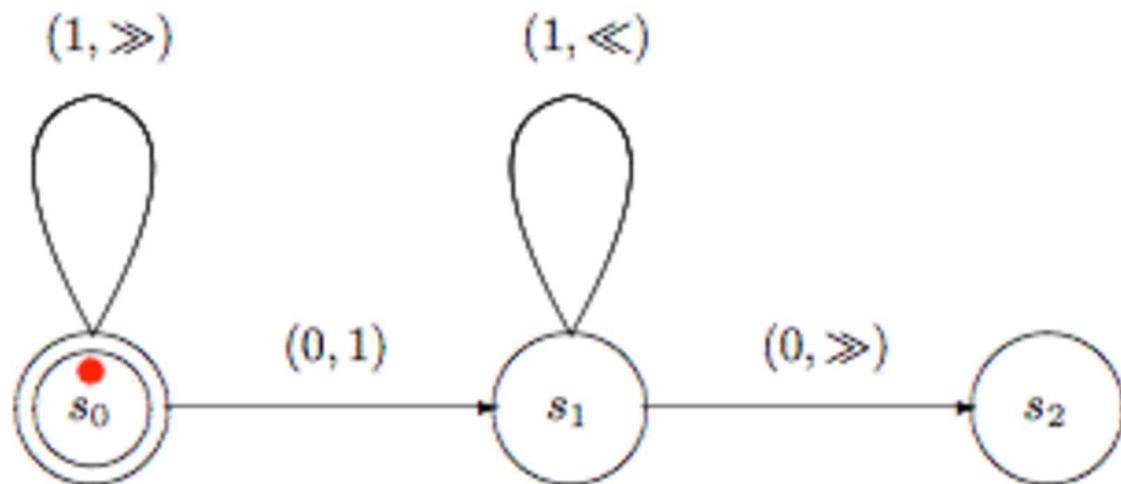

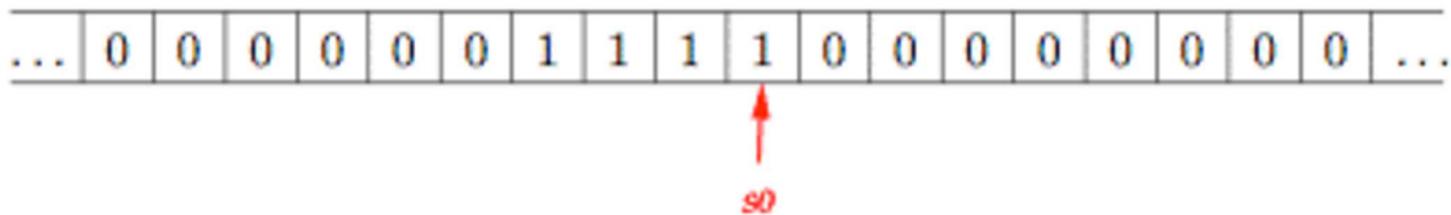

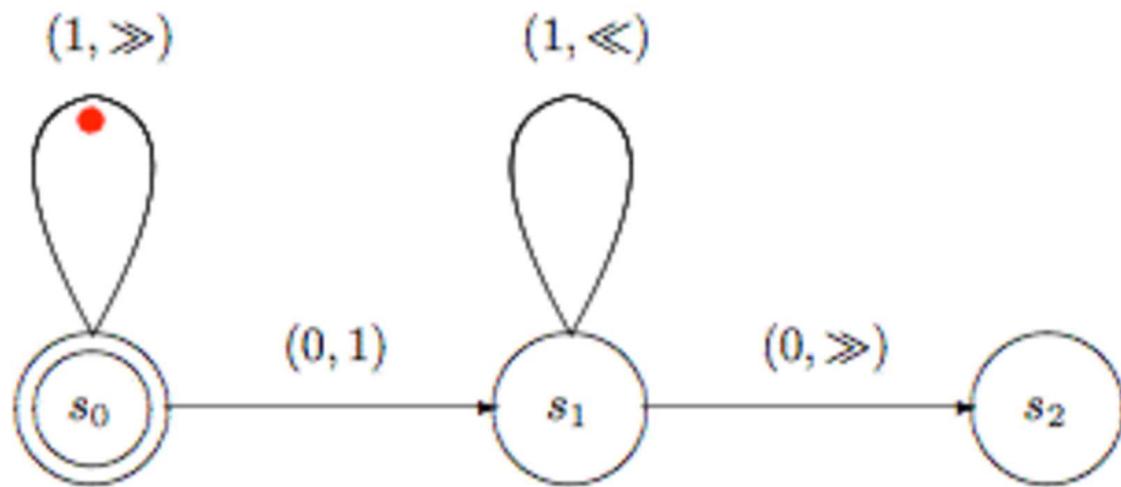

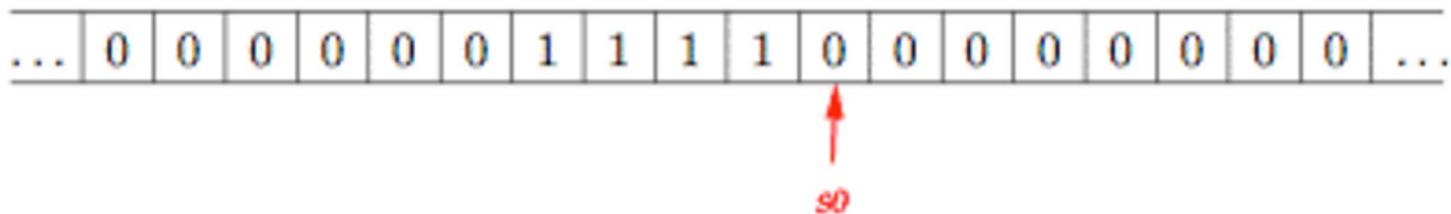

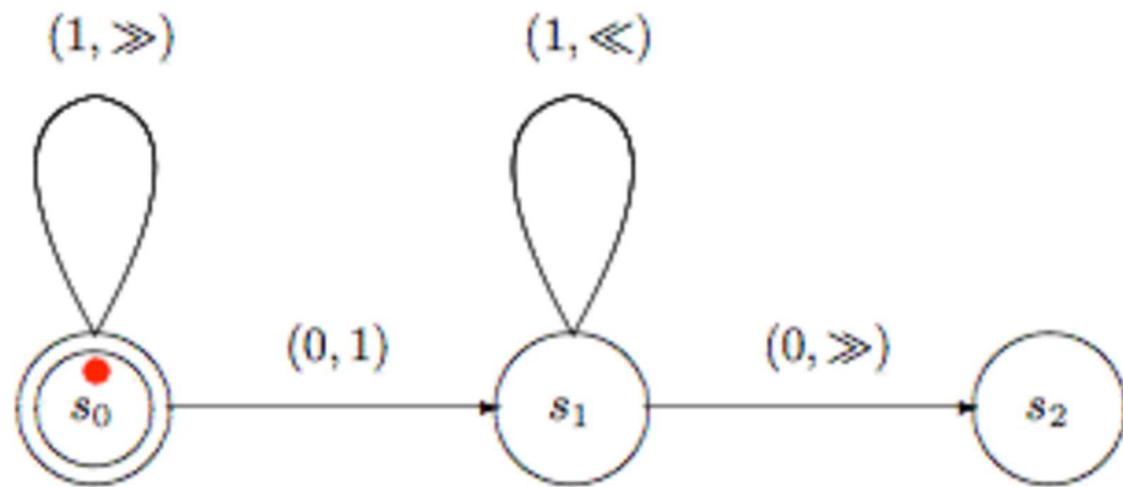

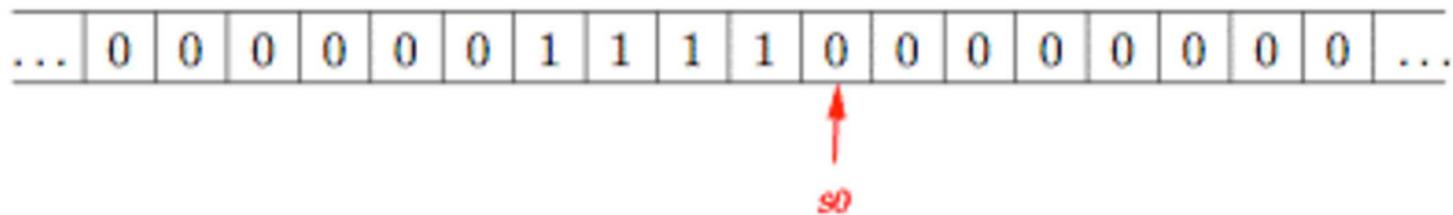

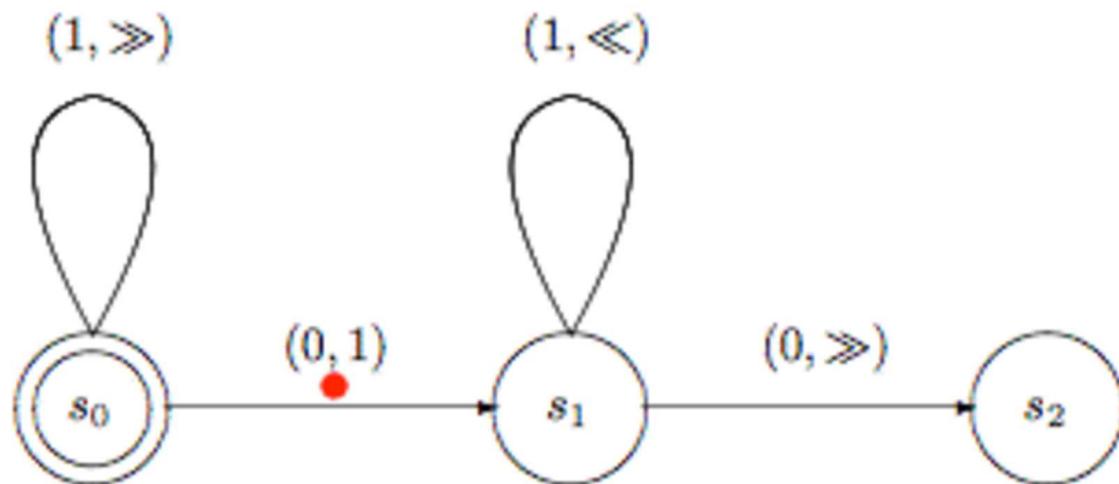

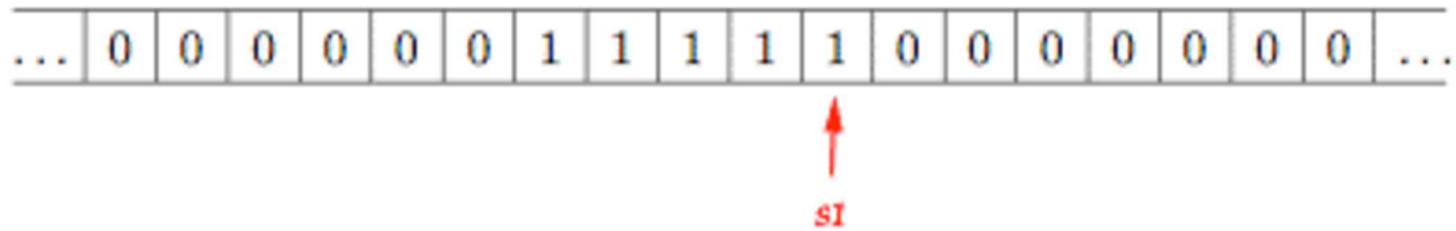

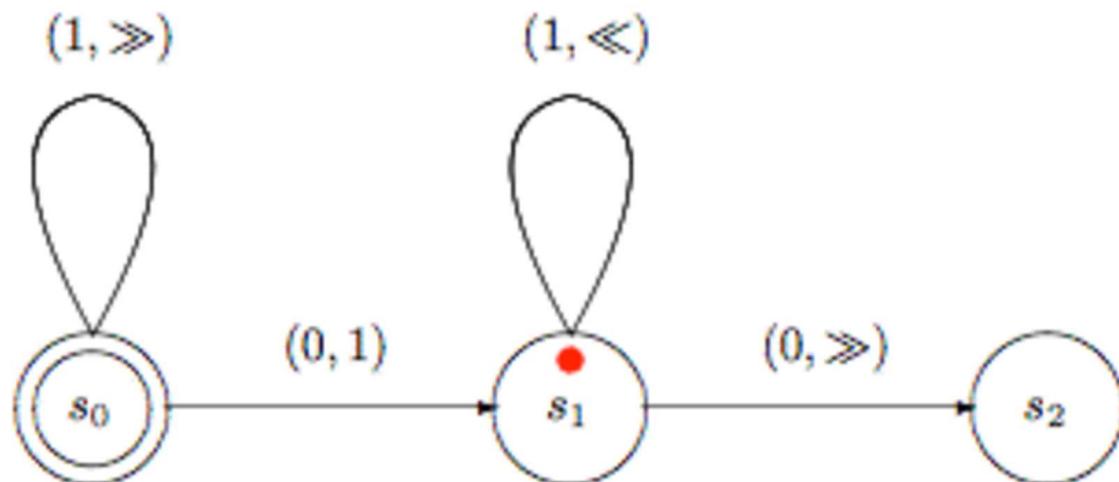

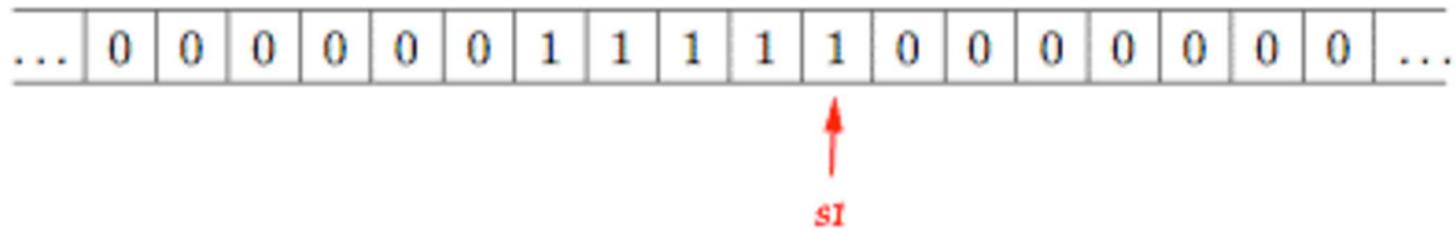

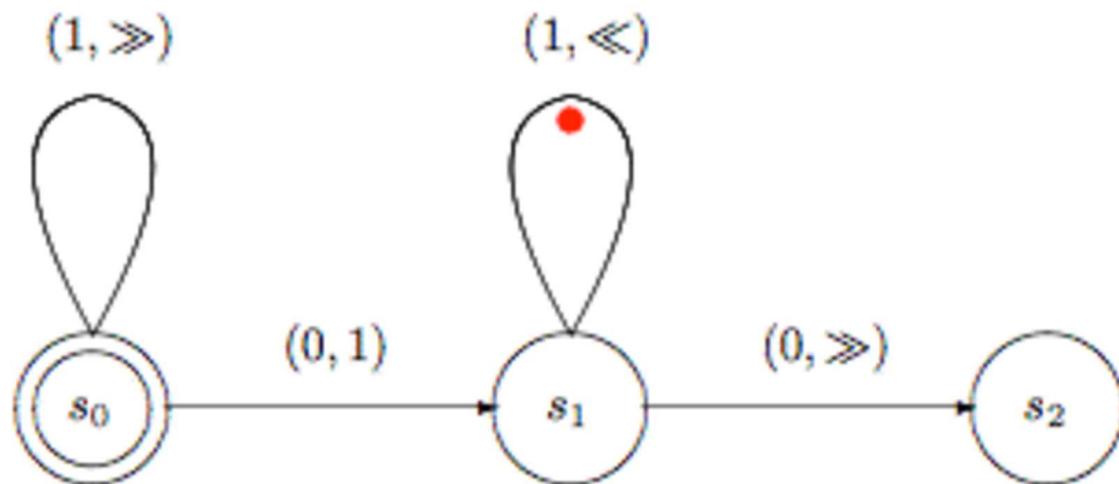

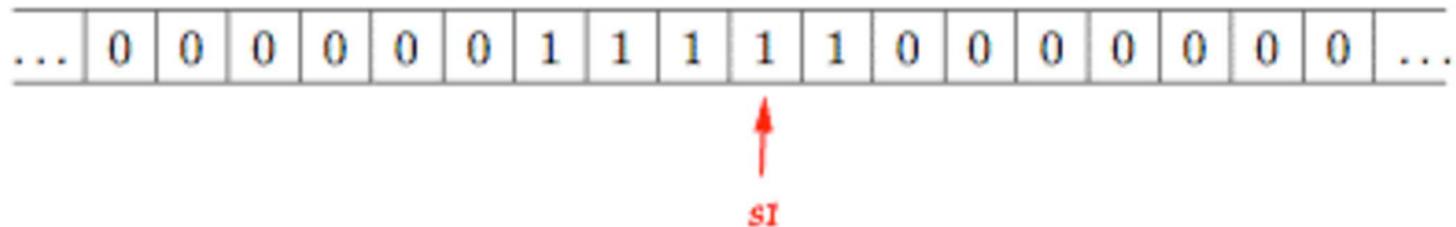

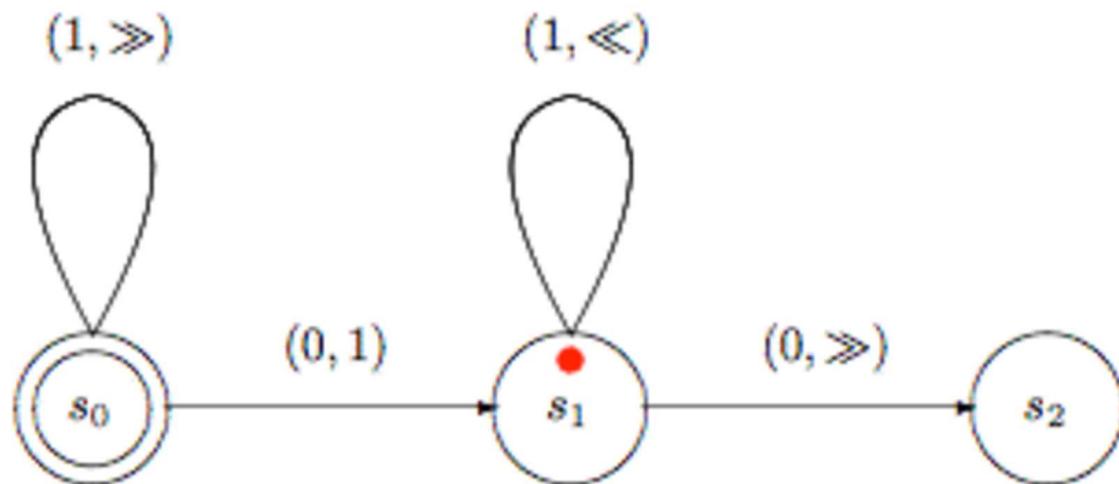

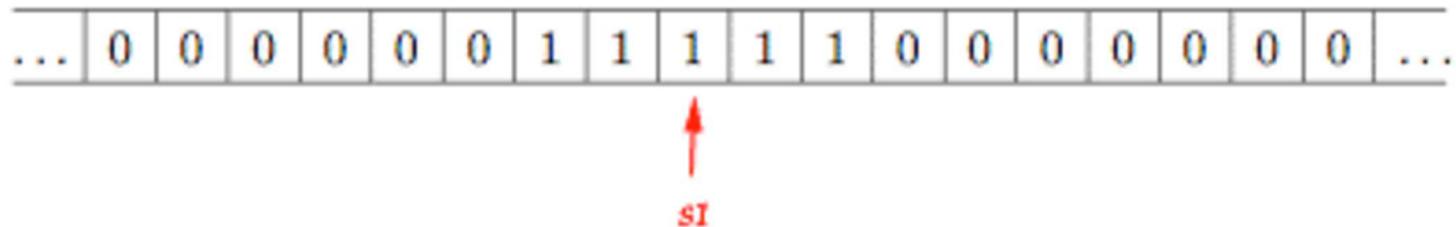

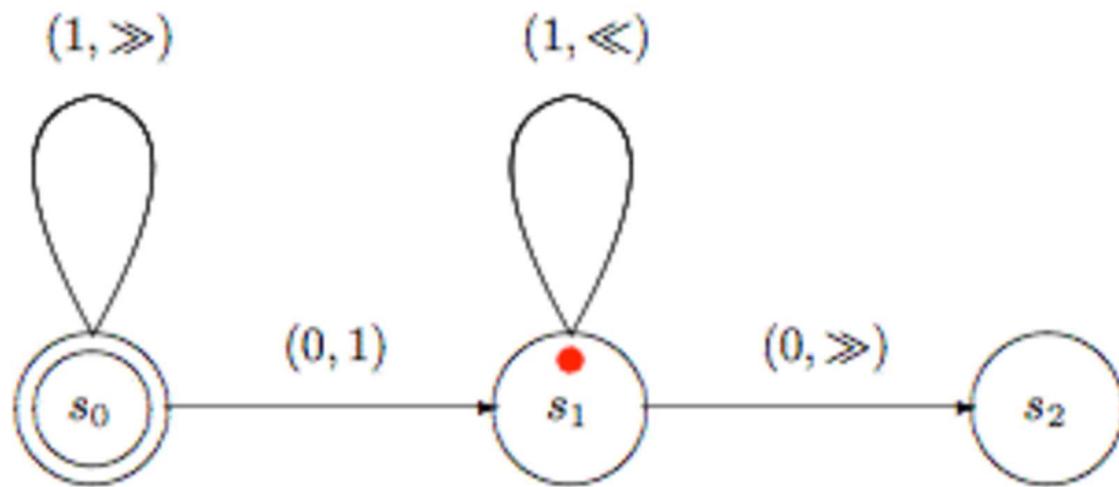

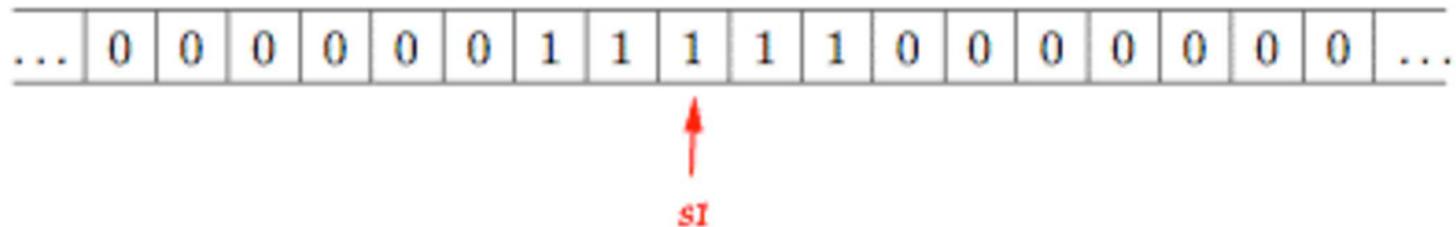

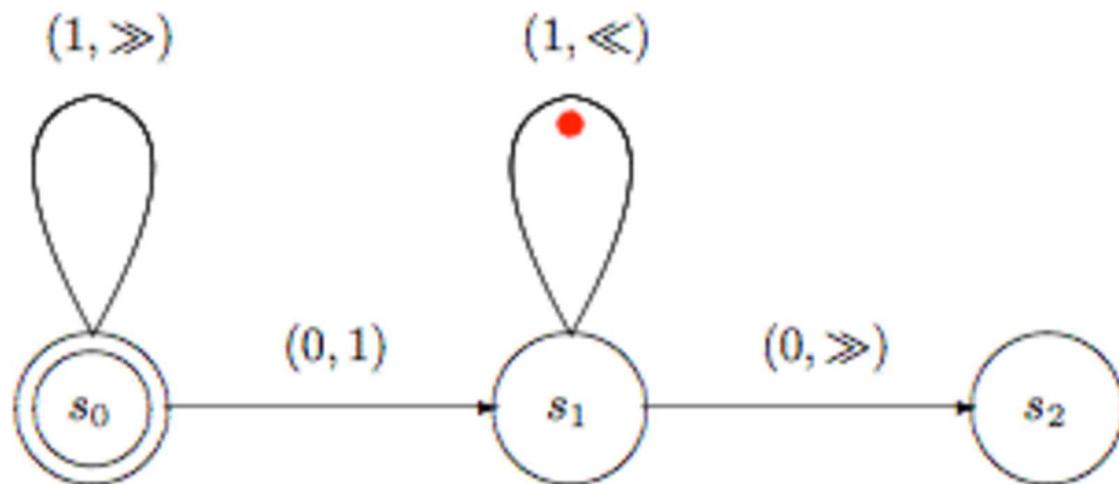

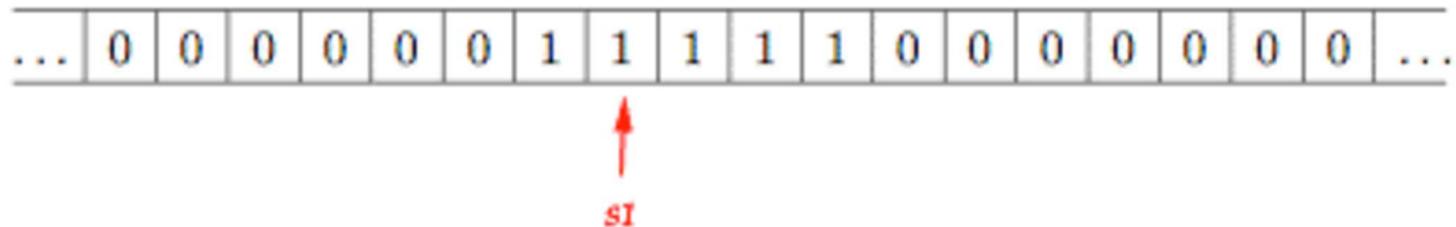

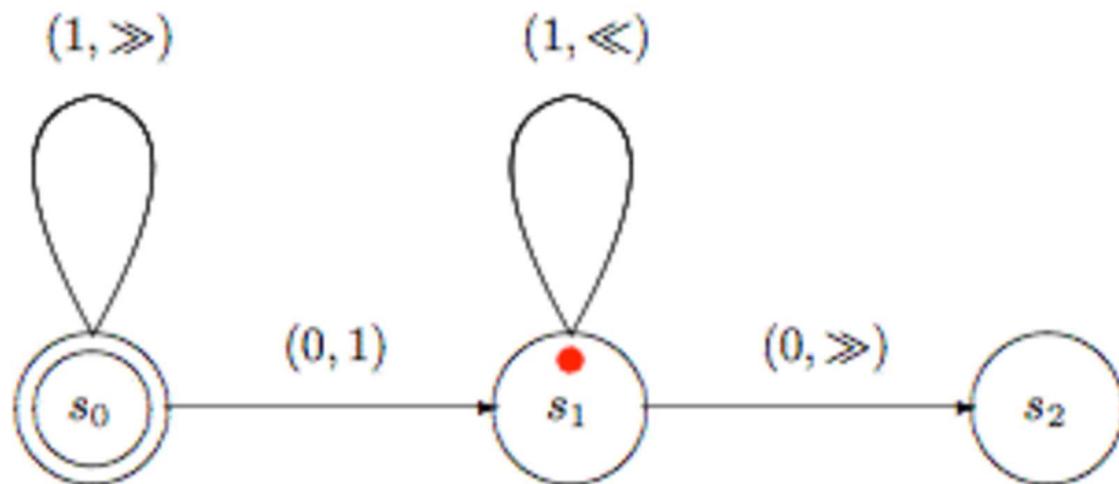

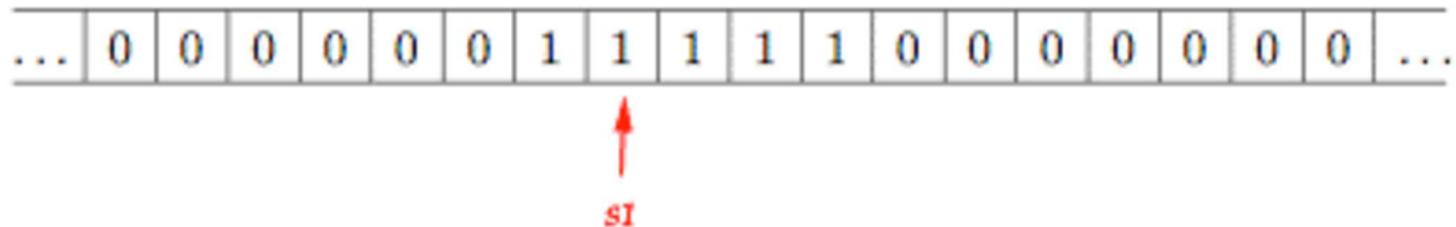

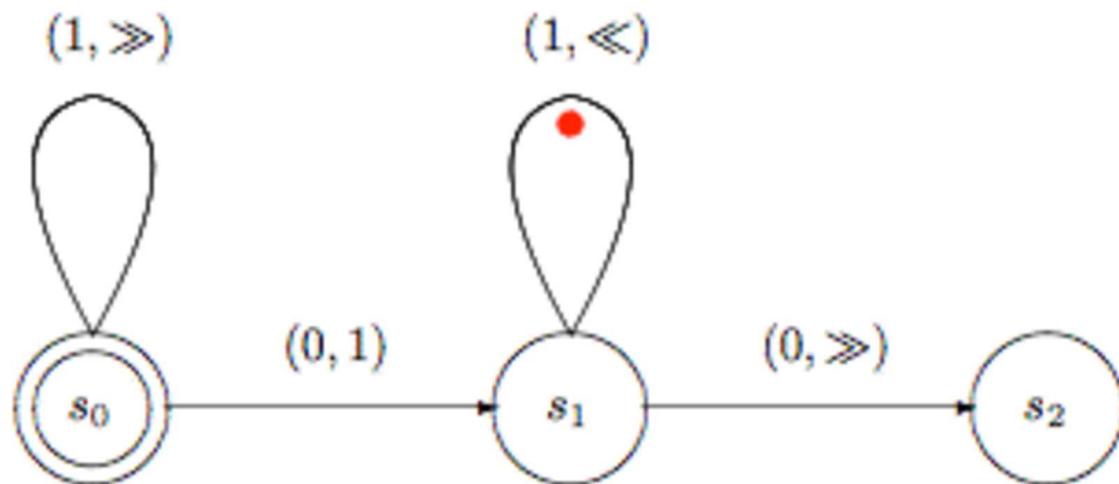

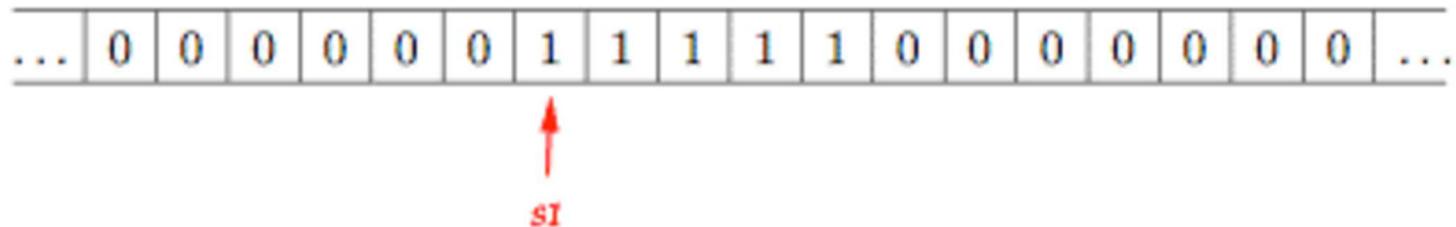

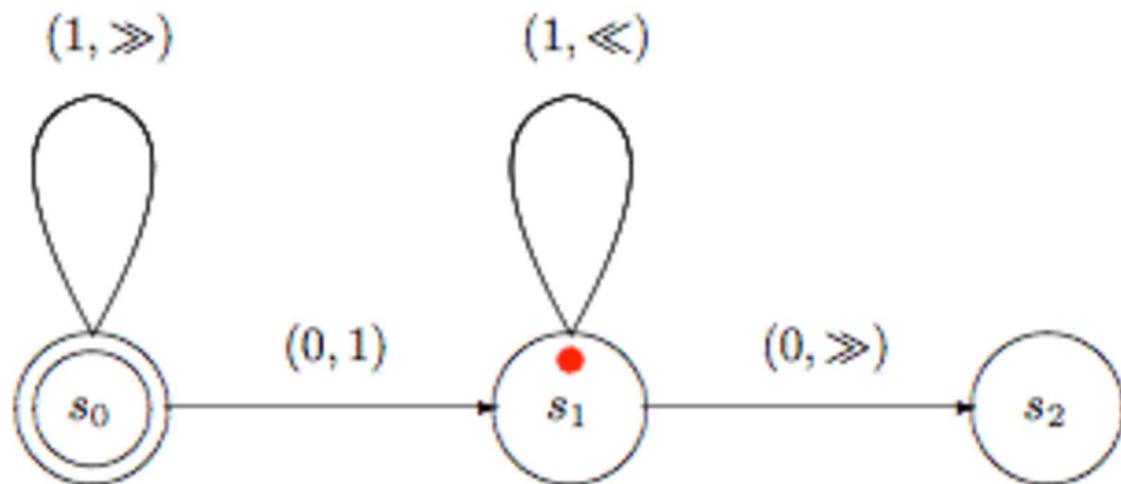

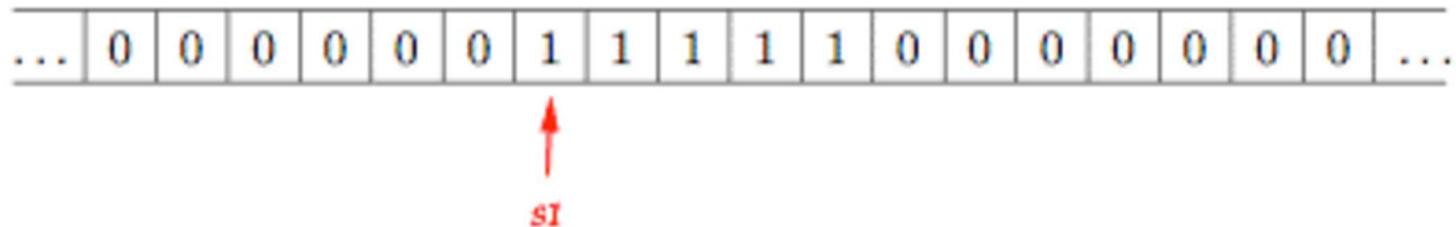

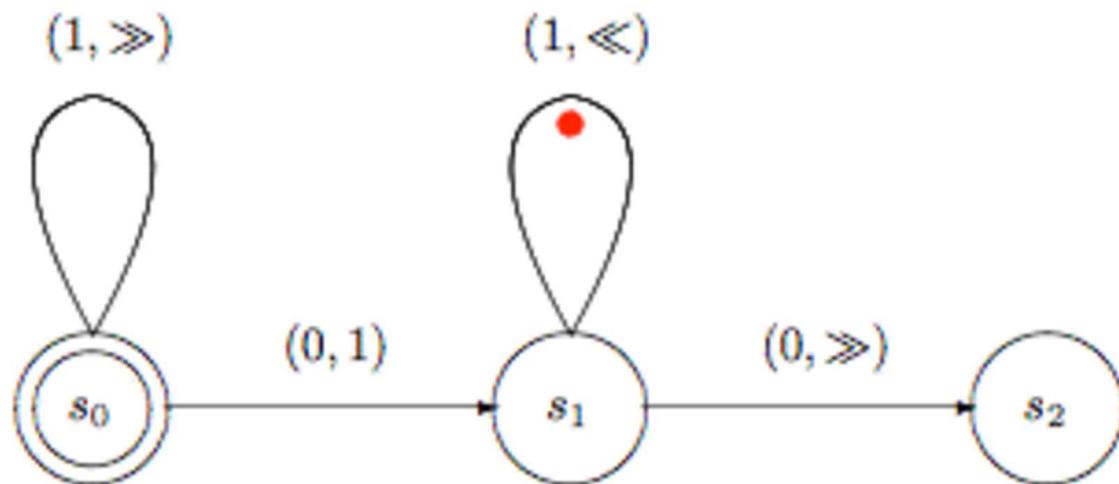

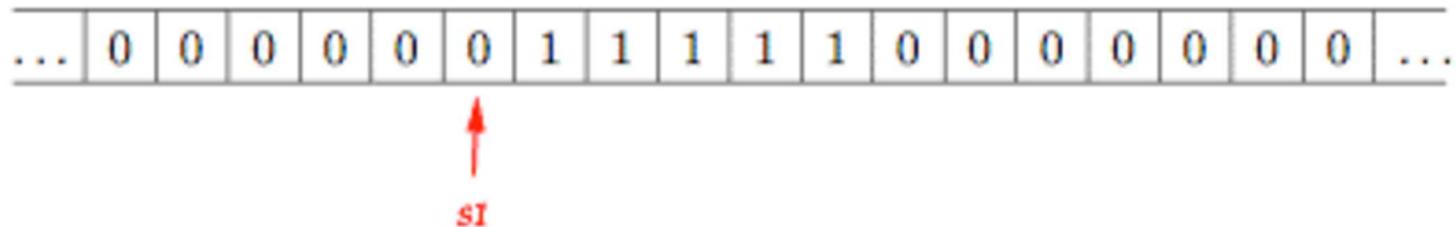

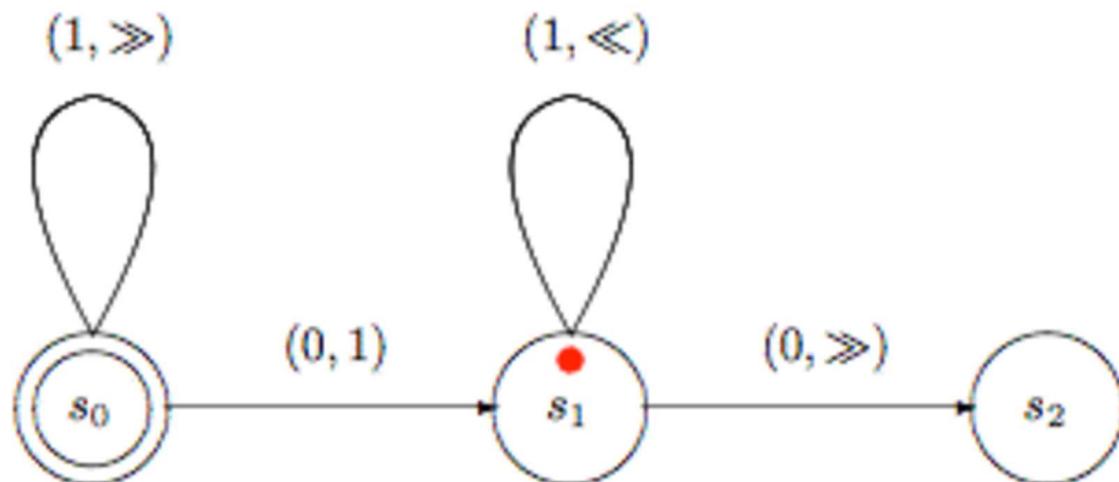

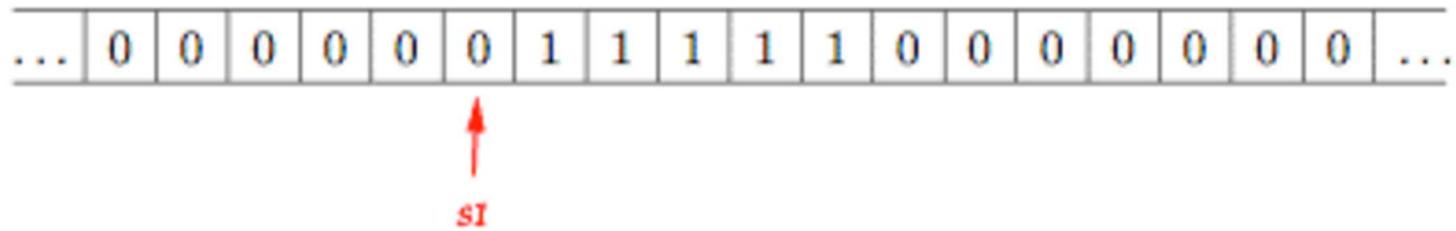

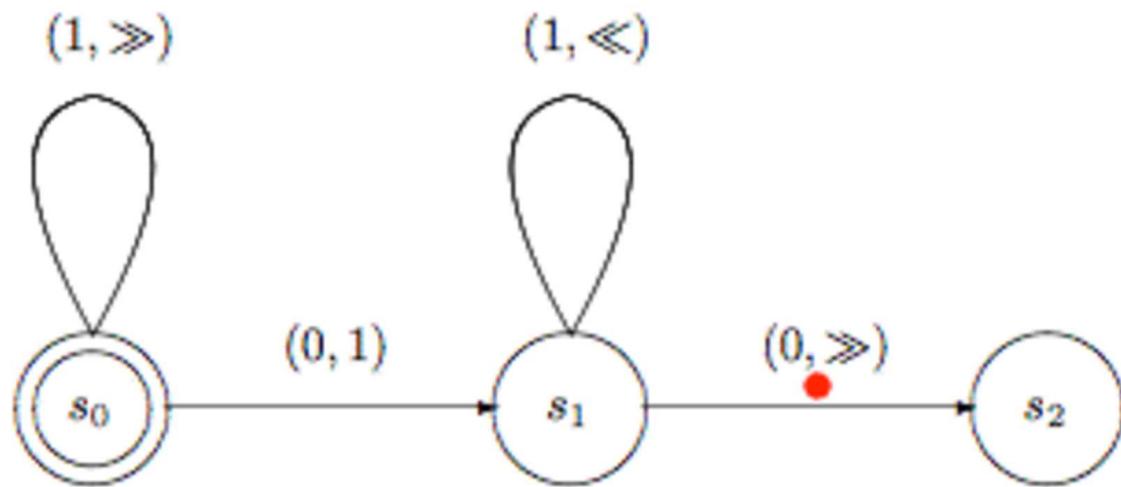

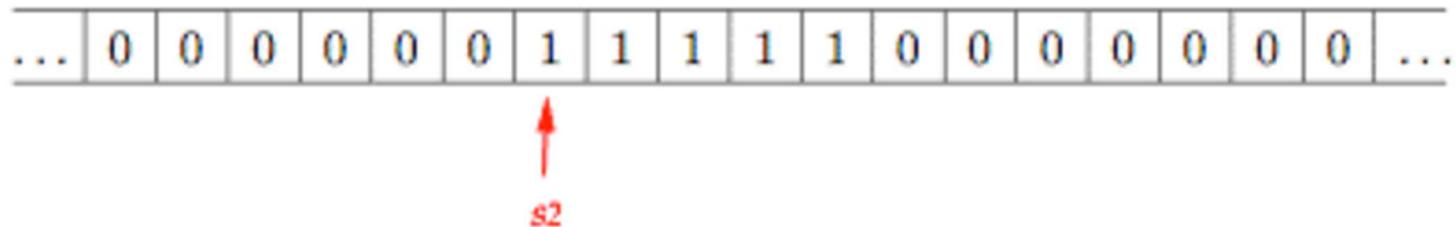

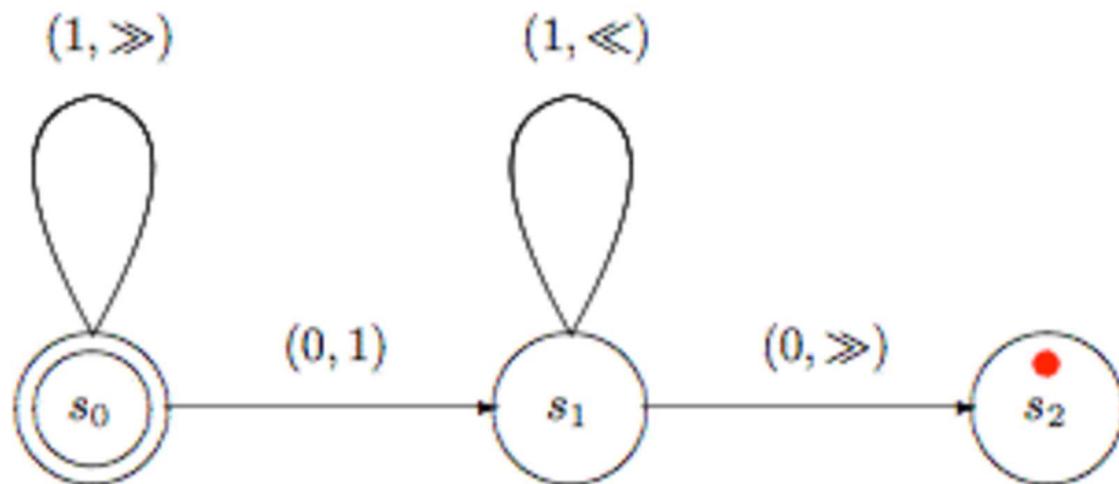

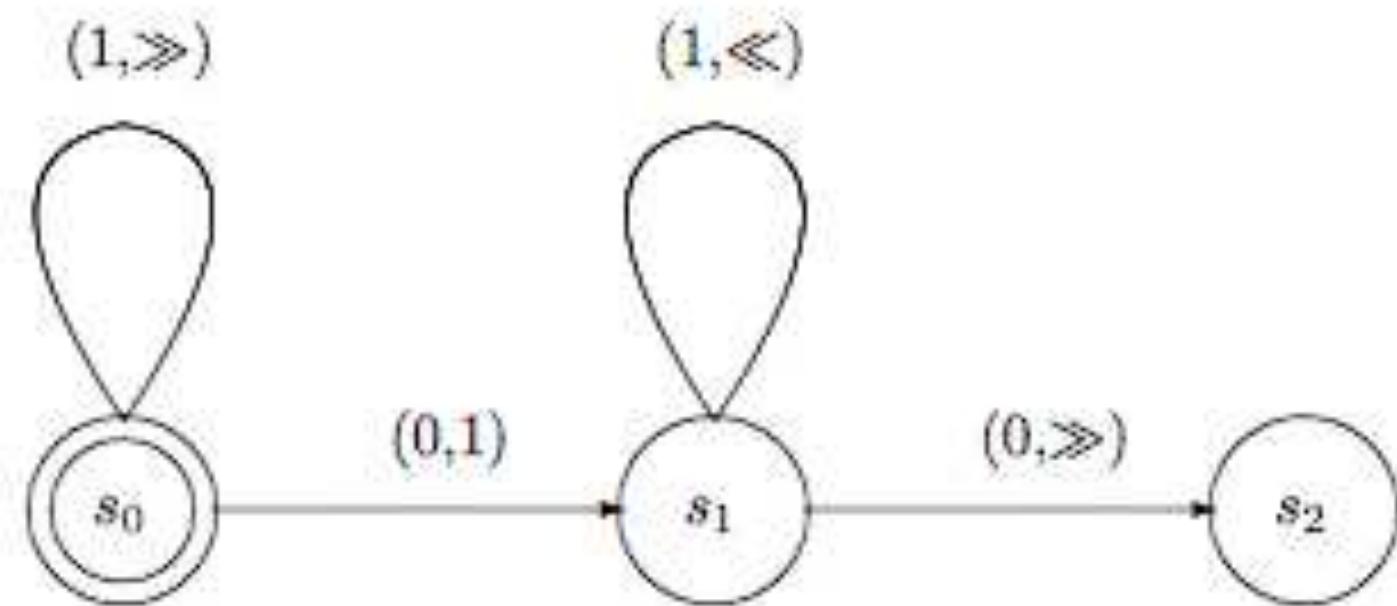

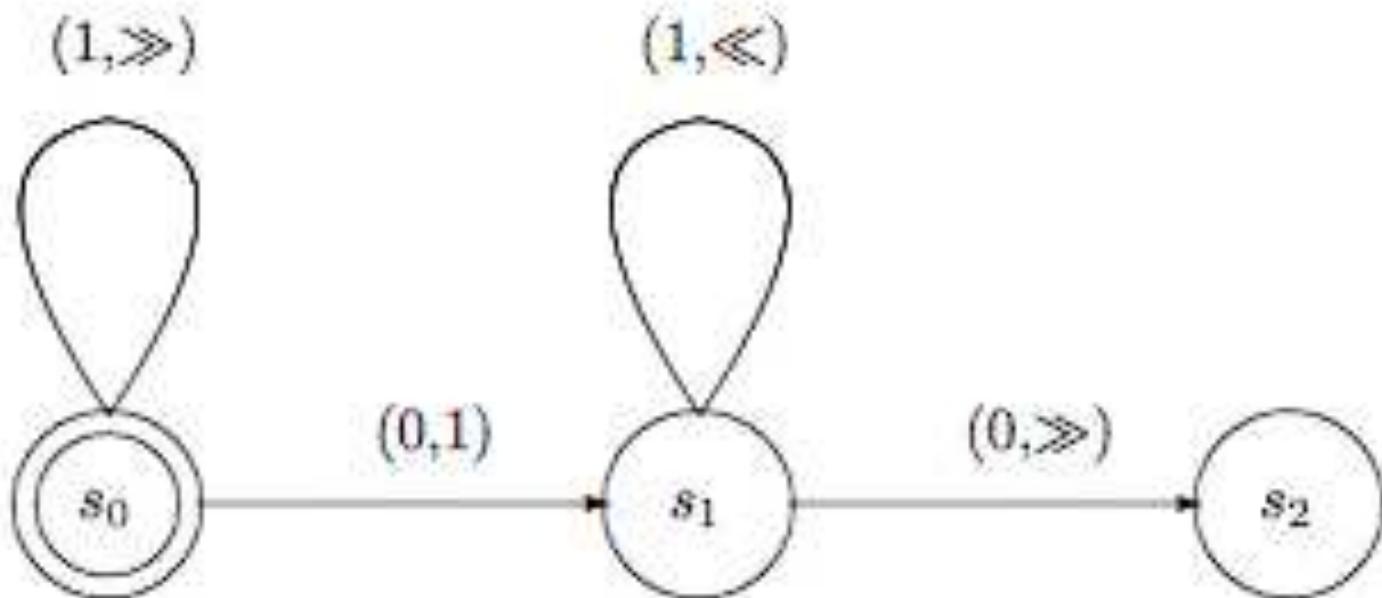

Question: what does it compute?

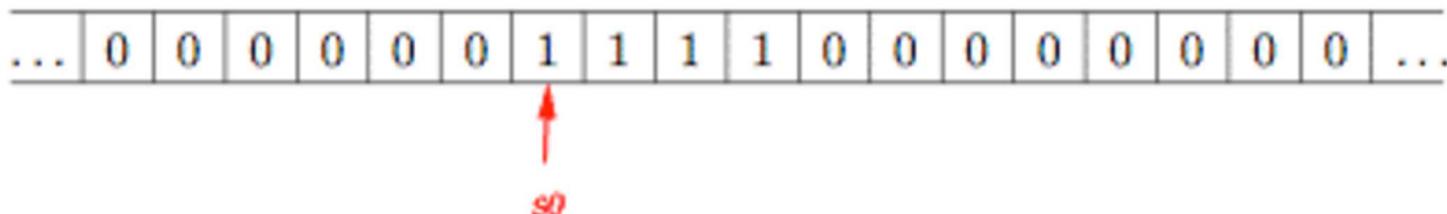

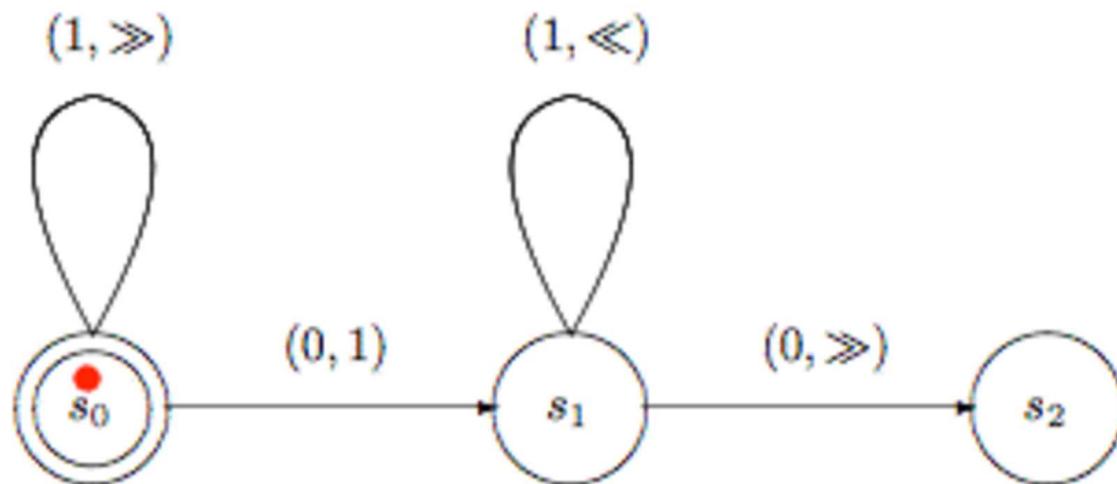

```
function succ (n) {  
    return n + 1;  
}
```

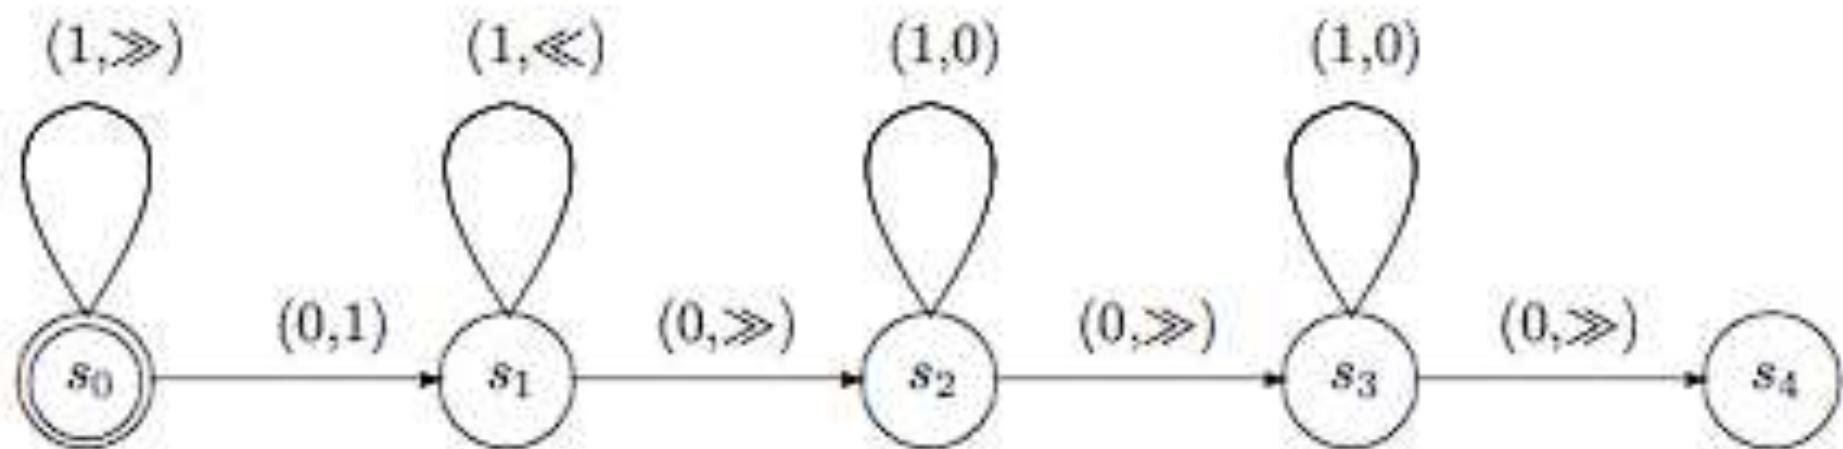

```
(lambda (x) (+ x 1))
```

Successor (add-one) function

assuming that number n as a block of $n+1$ copies of the symbol '1' on the tape (here, $n=3$)

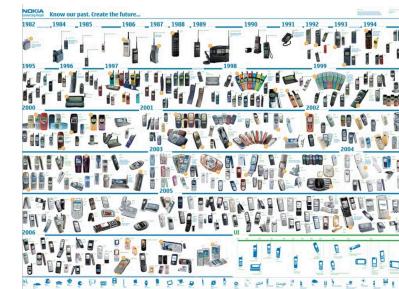

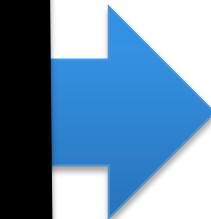

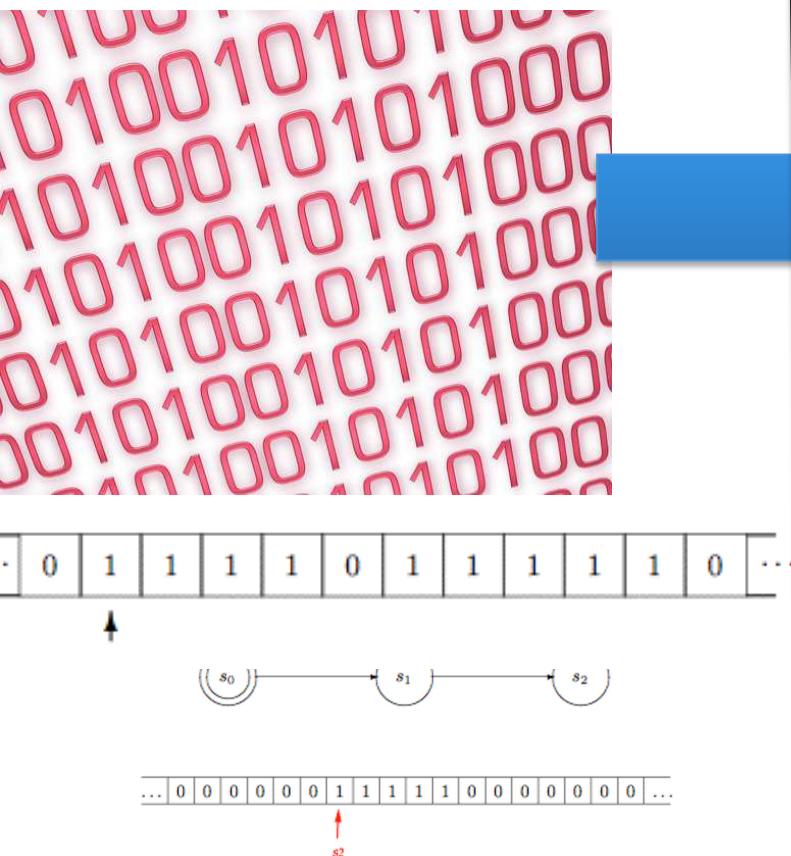

Addition of n+m

<http://graphics.stanford.edu/~seander/bithacks.html>

Maybe you prefer to use bit operations?

Implementing a Turing machine in Excel

Cory Doctorow at 2:20 pm Fri, Sep 20, 2013

142

24

The screenshot shows a Microsoft Excel spreadsheet titled "Turing Machine SuccessTable - Microsoft Excel". The spreadsheet contains a large grid of binary digits (0s and 1s) representing a state transition table for a Turing machine. The columns and rows are labeled with binary strings, likely representing states and symbols. The formula bar at the top shows a complex formula involving VLOOKUP, IFERROR, and other functions, demonstrating the implementation of a Turing machine's logic within Excel's formula system.

Formulas are Turing complete

DOING DOING GIFT GUIDE 2013 2013 GIFT GUIDE

AN ASTRONAUT'S GUIDE TO LIFE ON EARTH

The image shows the cover of a gift guide for 2013. The title "DOING DOING GIFT GUIDE 2013" is displayed in a stylized, overlapping font. Below it, the subtitle "2013 GIFT GUIDE" is shown. The main image on the cover is a photograph of an astronaut in a white spacesuit floating in the dark void of space, with stars visible in the background.

Formulas are Turing complete

Youtube video <https://t.co/RTfJAxXYaX>

<http://fr.slideshare.net/Felienne/spreadsheets-are-code-online>

Esoteric programming languages

- Designed to test the boundaries of computer programming language design, as a proof of concept, as software art, or as a joke.
 - extreme paradigms and design decisions
 - Eg <https://esolangs.org/wiki/Brainfuck>
- Usually, an esolang's creators do not intend the language to be used for mainstream programming.

(brainfuck)

What does it compute?

```
++++++[>++++++>++++++>+++<<<-]>++.>+.++++++  
..+++.>++.<<+++++++.>.+++.-----.-----.>+.
```

Questions to the audience

- Why assembly language is not the mainstream language?
- Why spreadsheets are not used for building Google?
- Why esoteric languages are not used for mainstream programming?

The answer to such « thought-provoking » questions seems obvious at first glance

- Help to define the good properties of software languages we expect
- Help to understand why there is still innovation in language design

Programming the Turing Machine

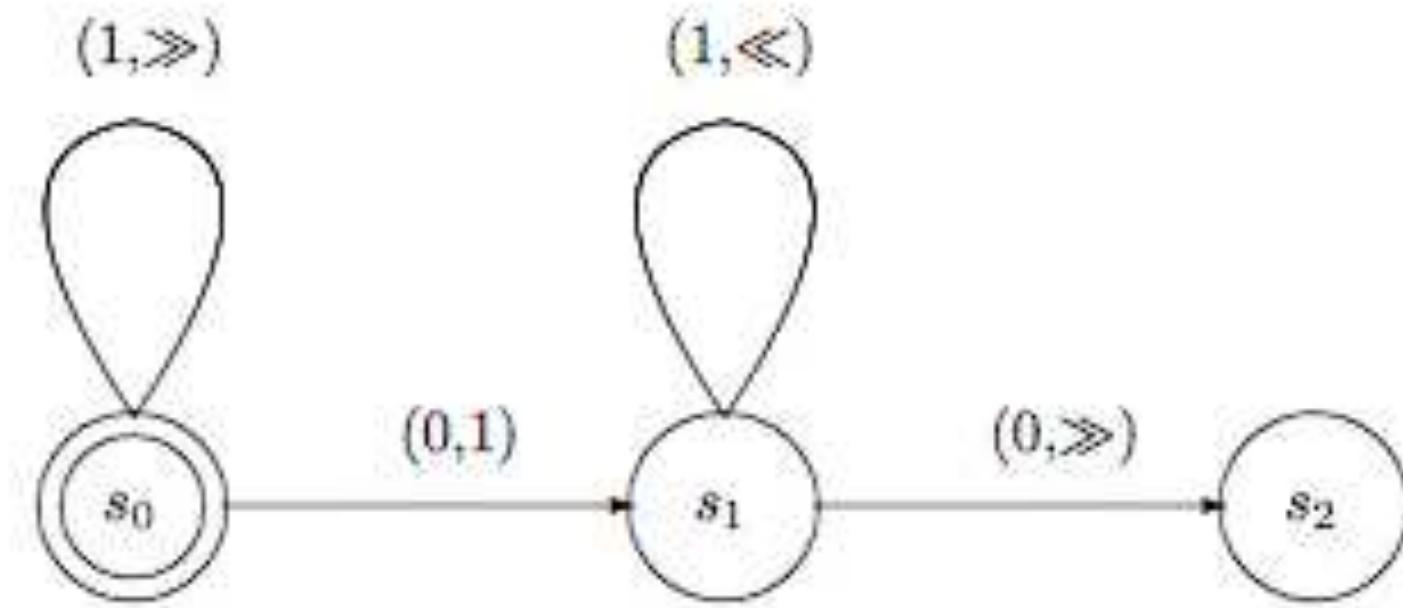

Why aren't we using tapes, states and transitions after all ?

Software Languages

Hard to write and understand.
No abstractions.
Hard to debug and test.
Poor language constructs. Poor tooling support.
Performance.
Usability, productivity,
reusability, safety,
expressiveness, learnability.

Question: what does it compute?

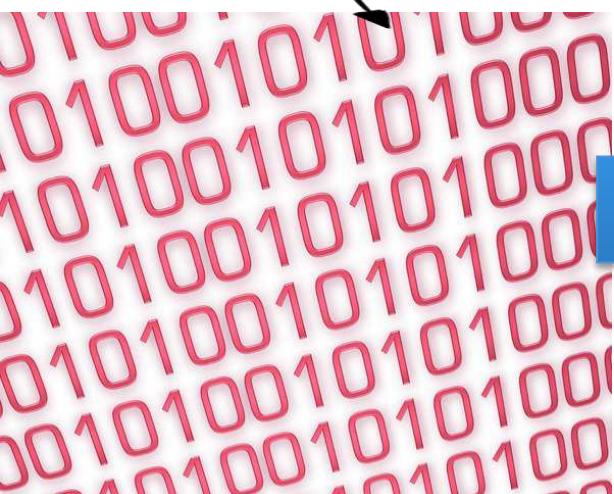

**Performance, usability,
productivity, reusability, safety,
expressiveness, learnability.**

Qualities and challenges

- Cognitive dimensions (see references after)
- Abstractions
 - Eg Kramer “Abstraction and Modelling - A Complementary Partnership” MODELS’08
- Separation of concerns/modularity
 - Eg Tarr et al., ICSE’99
- Scalability
 - Growing a language (like Scala)
- Performance
- ...

We need languages

1. At a high level of abstraction
 1. Still general-purpose
 2. Generation of other artefacts written in other languages
 3. Transformation, refinement
2. Multiplicity of languages
 1. Divide and conquer
 2. Specific to a problem or “domain”
 3. Induce a way to “compose” languages

(Combemale et al. “On the Globalization of Domain-Specific Languages”)

How Language Shapes Thought

The languages we speak affect our perceptions of the world

By Lera Boroditsky

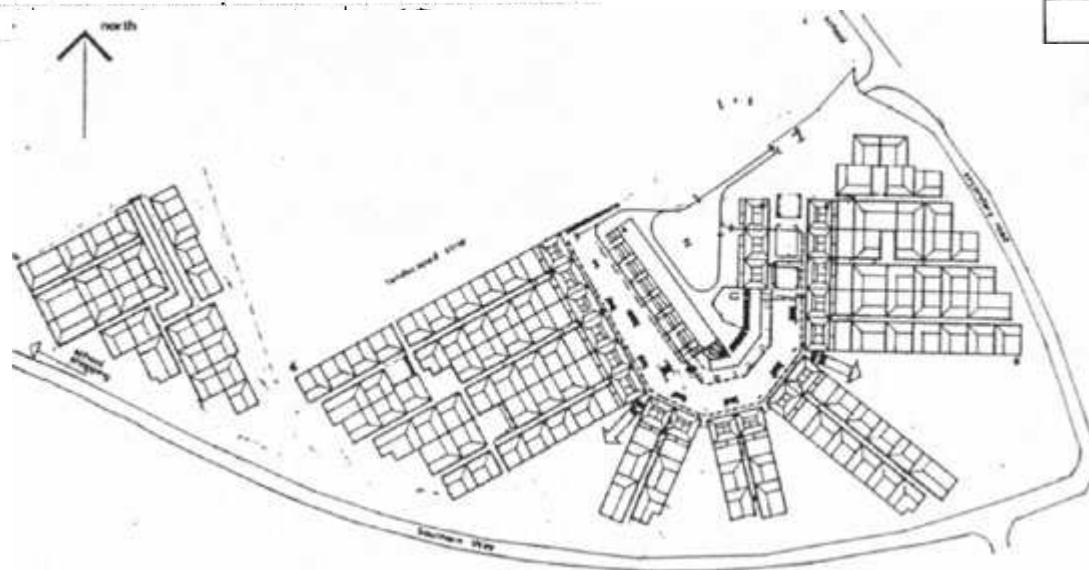

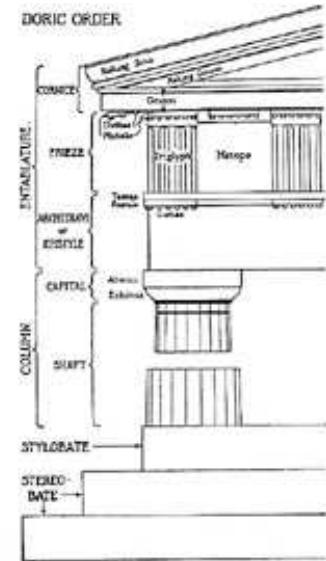

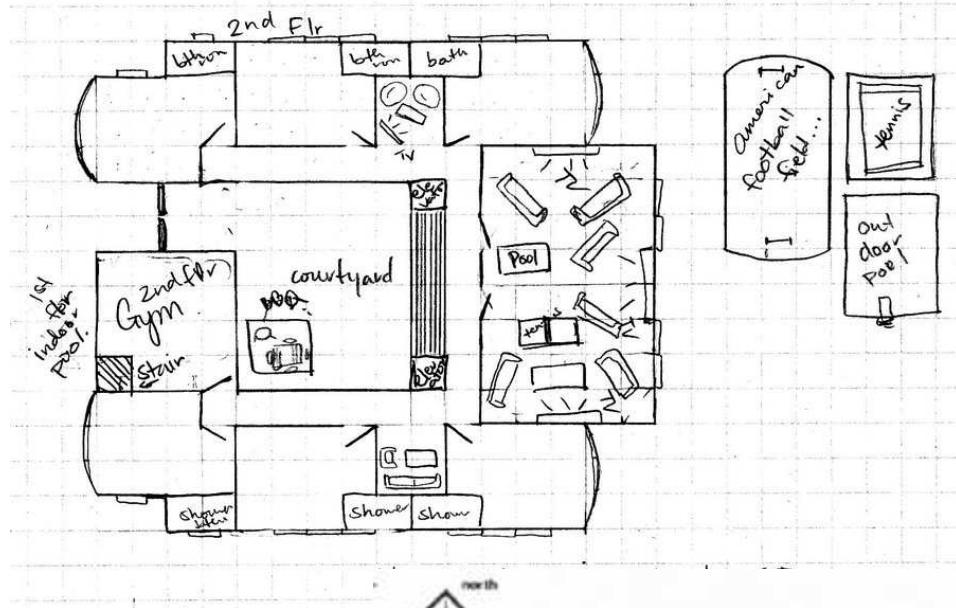

“Even variations in grammar can profoundly affect how we see the world.”

She's talking about real languages; **what about synthetic, programming languages?**

What is a language?

- « A system of signs, symbols, gestures, or rules used in **communicating** »
- « The **special** vocabulary and usages of a scientific, professional, or other group »
- « A system of symbols and rules used for communication with or between computers. »

twitter

Limits of General Purpose Languages (1)

- **Abstractions** and **notations** used are not natural/suitable for the stakeholders

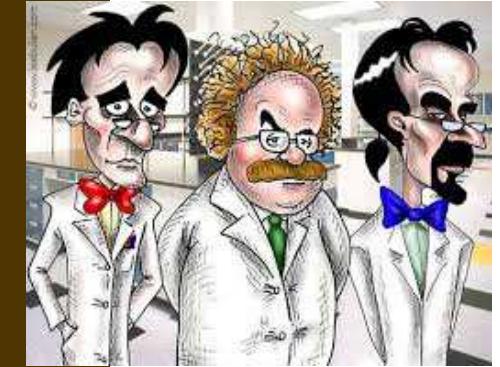

designer

User Interface Designer with a passion for designing beautiful and functional user experiences. Minimalist who believes that less is more.

```
if (newGame) resources.free();
s = FILENAME + 3;
setLocation(); load(s);
loadDialog.process();

try { setGamerColor(RED); }
catch(Exception e) { reset(); }
while (notReady) { objects.make();
if (resourceNotFound) break;

byte result; // сменить на int!
music();
System.out.print("");
```

Limits of General Purpose Languages (2)

- Not targeted to a **particular** kind of problem, but to any kinds of software problem.

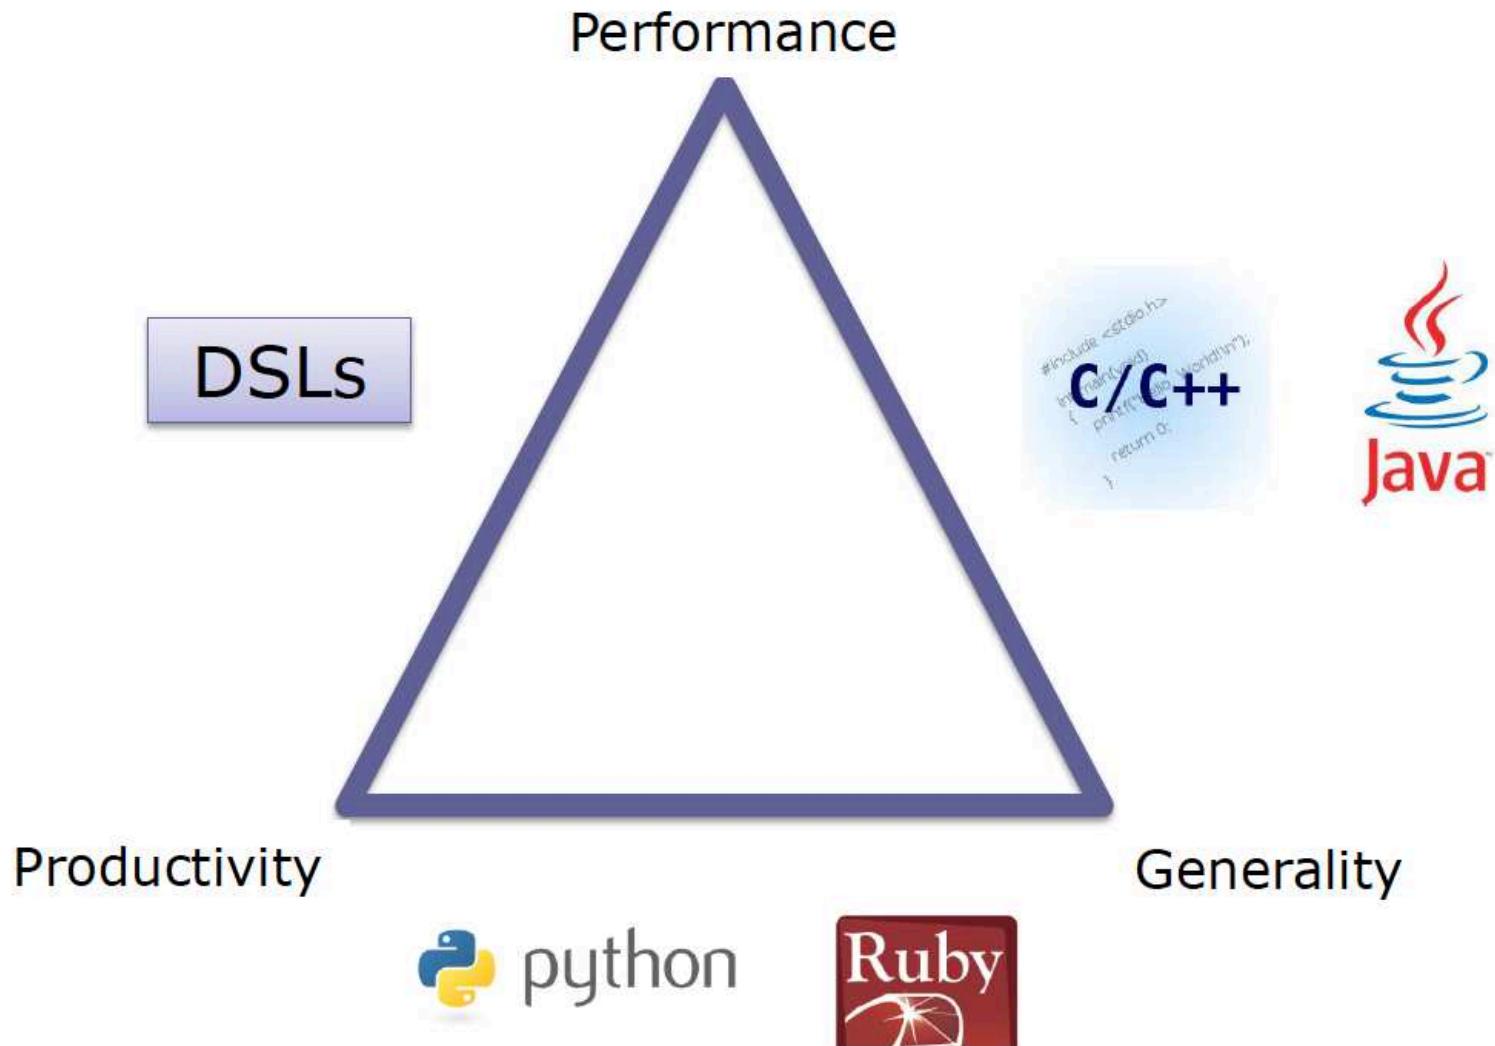

Domain Specific Languages

- Targeted to a **particular** kind of problem, with dedicated notations (textual or graphical), support (editor, checkers, etc.)
- Promises: more « efficient » languages for resolving a set of specific problems in a domain

A discussable view (slide “OptiML...” Sujeeth et al., ICML’11)

Domain Specific Languages (DSLs)

- Long history: used for almost as long as computing has been done.
- You're using DSLs in a daily basis
- You've learnt many DSLs in your curriculum
- Examples to come!

HTML

```
<?xml version="1.0" encoding="iso-8859-1"?>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "DTD/xhtml1-transitional.dtd">
<html xml:lang="en" lang="en" xmlns="http://www.w3.org/1999/xhtml">
  <head>
    <title>Hello World</title>
  </head>
  <body>
    <p>My first Web page.</p>
  </body>
</html>
```

Domain: web (markup)

CSS

```
.CodeMirror {  
    line-height: 1;  
    position: relative;  
    overflow: hidden;  
}  
  
.CodeMirror-scroll {  
    /* 30px is the magic margin used to hide the element's real scrollbars */  
    /* See overflow: hidden in .CodeMirror, and the paddings in .CodeMirror-sizer */  
    margin-bottom: -30px; margin-right: -30px;  
    padding-bottom: 30px; padding-right: 30px;  
    height: 100%;  
    outline: none; /* Prevent dragging from highlighting the element */  
    position: relative;  
}  
.CodeMirror-sizer {  
    position: relative;  
}
```

Domain: web (styling)

SQL

```
SELECT Book.title AS Title,  
       COUNT(*) AS Authors  
  FROM Book  
 JOIN Book_author  
    ON Book.isbn = Book_author.isbn  
GROUP BY Book.title;
```

```
INSERT INTO example  
(field1, field2, field3)  
VALUES  
( 'test' , 'N' , NULL);
```

Domain: database (query)

Makefile

```
PACKAGE      = package
VERSION      = `date "+%Y.%m%d%" `
RELEASE_DIR  = ..
RELEASE_FILE = $(PACKAGE)-$(VERSION)

# Notice that the variable LOGNAME comes from the environment in
# POSIX shells.
#
# target: all - Default target. Does nothing.
all:
    echo "Hello $(LOGNAME), nothing to do by default"
    # sometimes: echo "Hello ${LOGNAME}, nothing to do by default"
    echo "Try 'make help'"

# target: help - Display callable targets.
help:
    egrep "^# target:" [Mm]akefile

# target: list - List source files
list:
    # Won't work. Each command is in separate shell
    cd src
    ls

    # Correct, continuation of the same shell
    cd src; \
    ls
```

Domain: software building

Lighttpd configuration file

```
server.document-root = "/var/www/servers/www.example.org/pages/"

server.port = 80

server.username = "www"
server.groupname = "www"

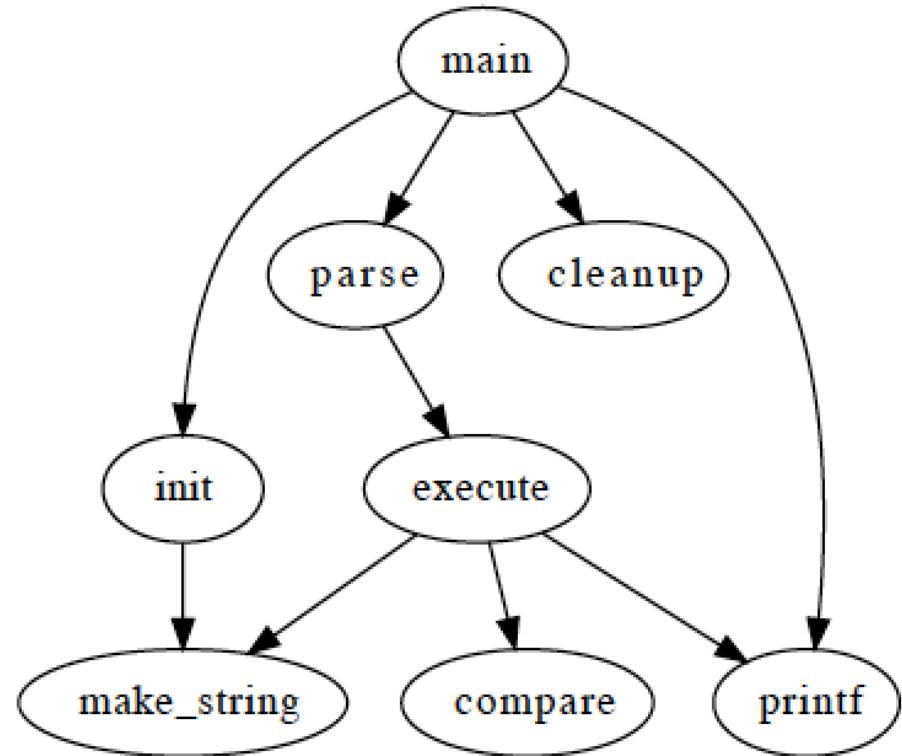

mimetype.assign = (
    ".html" => "text/html",
    ".txt" => "text/plain",
    ".jpg" => "image/jpeg",
    ".png" => "image/png"
)

static-file.exclude-extensions = ( ".fcgi", ".php", ".rb", "~", ".inc" )
index-file.names = ( "index.html" )
```

Domain: web server (configuration)

Graphviz

« Another lesson we should have learned from the recent past is that the development of 'richer' or 'more powerful' programming languages was a mistake in the sense that these baroque monstrosities, these conglomerations of idiosyncrasies, are really unmanageable, both mechanically and mentally.

aka General-Purpose Languages

I see a great future for very systematic and very modest programming languages »

**« Domain-specific
languages are far more
prevalent than
anticipated »**

The Addison-Wesley Signature Series

DOMAIN-SPECIFIC LANGUAGES

MARTIN FOWLER
WITH REBECCA PARSONS

A MARTIN FOWLER
Signature Book
Martin Fowler

2011

What is a domain-specific language ?

- « Language **specially** designed to perform a task in a **certain domain** »
- « A formal processable language targeting at a **specific viewpoint or aspect** of a software system. Its **semantics and notation** is designed in order to support working with that viewpoint as good as possible »
- « A computer language that's targeted to a particular kind of problem, **rather than a general purpose language** that's aimed at any kind of software problem. »

GPL (General Purpose Language)

A GPL provides notations that are used to describe a computation in a human-readable form that can be translated into a machine-readable representation.

A GPL is a formal notation that can be used to describe problem solutions in a precise manner.

A GPL is a notation that can be used to write programs.

A GPL is a notation for expressing computation.

A GPL is a standardized communication technique for expressing instructions to a computer. It is a set of syntactic and semantic rules used to define computer programs.

Promises of domain-specific languages

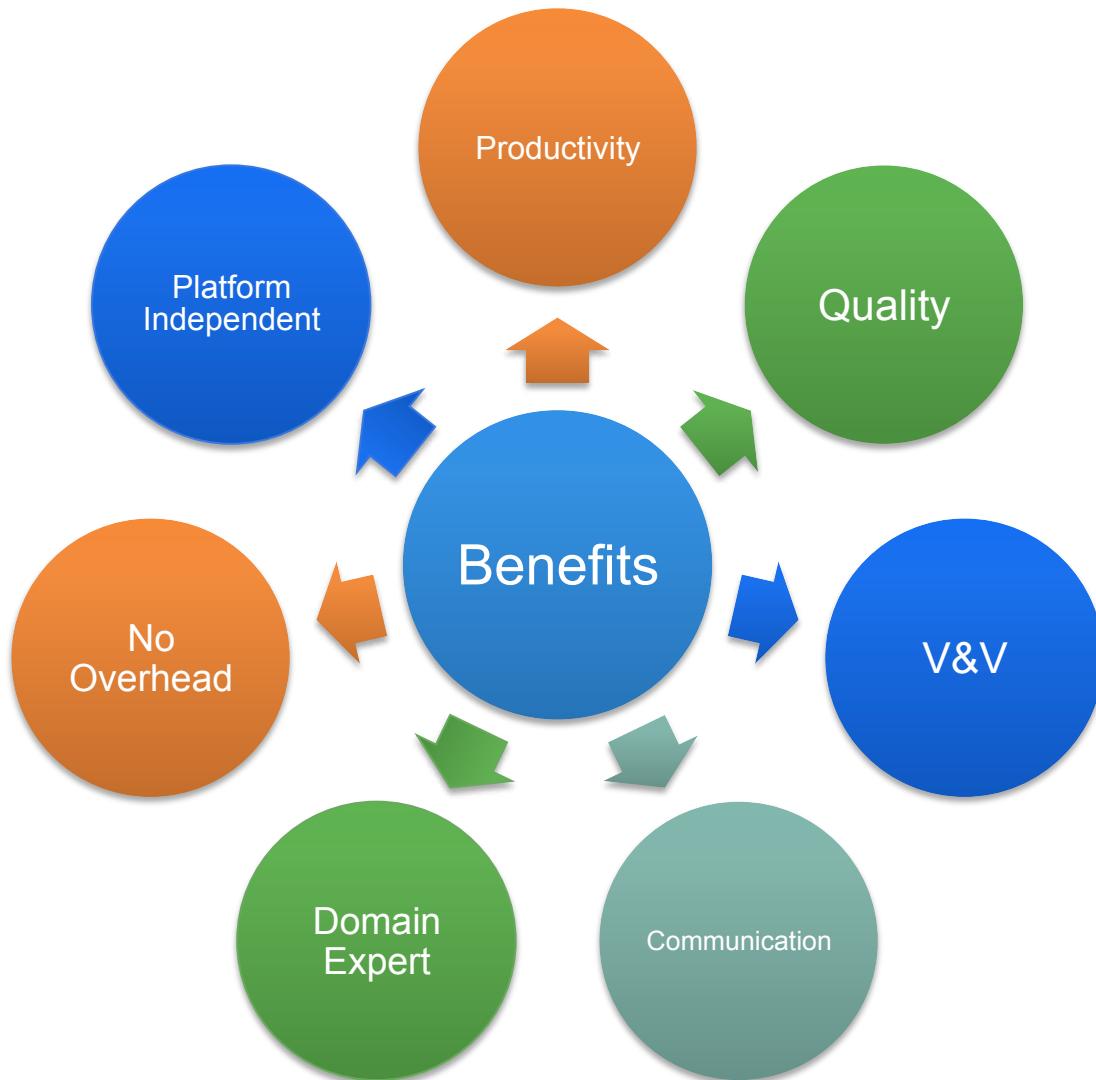

Higher abstractions

Avoid redundancy

Separation of concerns

Use domain concepts

Promises of domain-specific languages

GeneralPL vs DomainSL

The boundary isn't as clear as it could be. Domain-specificity is not black-and-white, but instead gradual: a language is more or less domain specific

	GPLs	DSLs
Domain	large and complex	smaller and well-defined
Language size	large	small
Turing completeness	always	often not
User-defined abstractions	sophisticated	limited
Execution	via intermediate GPL	native
Lifespan	years to decades	months to years (driven by context)
Designed by	guru or committee	a few engineers and domain experts
User community	large, anonymous and widespread	small, accessible and local
Evolution	slow, often standardized	fast-paced
Deprecation/incompatible changes	almost impossible	feasible

Specializing syntax and environment pays off?

- Promises of DSL « improvement » in terms of
 - usability, learnability, expressiveness, reusability, etc.
- Empirical study on the role of **syntax**
 - C-style syntax induces problems in terms of usability for novices; language more or less intuitive for (non-)programmers (Stefik et al. 2014)
 - Syntax issues with Java for students (Denny et al. 2011)
 - PL usability: method namings/placement, use of identifiers, API design (Ellis et al., Styllos et al., Clarke, Montperrus et al., etc.)
- More **specialized/sophicated tools/IDE** can be derived from a DSL
 - editors, compilers, debuggers

Question to the audience

- Take one DSL and formulate assumptions on their qualities (and superiority to a GPL-based solution)
- Imagine an experience for providing evidence that the DSL has such qualities

External DSLs vs Internal DSLs

- An **external** DSL is a completely separate language and has its own custom syntax/tooling support (e.g., editor)
- An internal DSL is more or less a set of APIs written on top of a host language (e.g., Java).
 - Fluent interfaces

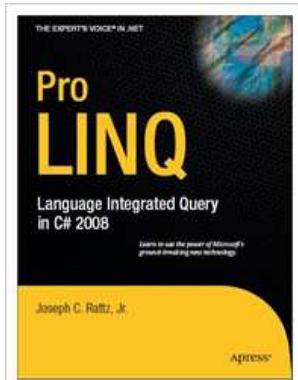

External vs Internal DSL (SQL example)

```
-- Select all books by authors born after 1920,  
-- named "Paulo" from a catalogue:  
SELECT *  
FROM t_author a  
JOIN t_book b ON a.id = b.author_id  
WHERE a.year_of_birth > 1920  
    AND a.first_name = 'Paulo'  
ORDER BY b.title
```

```
Result<Record> result =  
create.select()  
    .from(T_AUTHOR.as("a"))  
    .join(T_BOOK.as("b")).on(a.ID.equal(b.AUTHOR_ID))  
    .where(a.YEAR_OF_BIRTH.greaterThan(1920))  
    .and(a.FIRST_NAME.equal("Paulo"))  
    .orderBy(b.TITLE)  
    .fetch();
```

Internal DSL (LINQ/C# example)

```
// DataContext takes a connection string
DataContext db = new DataContext("c:\\northwind\\northwnd.mdf");
// Get a typed table to run queries
Table<Customer> Customers = db.GetTable<Customer>();
// Query for customers from London
var q =
    from c in Customers
    where c.City == "London"
    select c;
foreach (var cust in q)
    Console.WriteLine("id = {0}, City = {1}", cust.CustomerID, cust.City);
```

Internal DSL

- « Using a host language (e.g., Java) to give the host language the feel of a particular language. »
- Fluent Interfaces**
 - « The more the use of the API has that language like flow, the more fluent it is »

```
Result<Record> result =
    create.select()
        .from(T_AUTHOR.as("a"))
        .join(T_BOOK.as("b")).on(a.ID.equal(b.AUTHOR_ID))
        .where(a.YEAR_OF_BIRTH.greaterThan(1920))
        .and(a.FIRST_NAME.equal("Paulo")))
        .orderBy(b.TITLE)
        .fetch();
```

```
-- Select all books by authors born after 1920,
-- named "Paulo" from a catalogue:
SELECT *
FROM t_author a
JOIN t_book b ON a.id = b.author_id
WHERE a.year_of_birth > 1920
    AND a.first_name = 'Paulo'
ORDER BY b.title
```

SQL in... Java

DSL in GPL

```
Connection con = null;

// create sql insert query
String query = "insert into user values(" + student.getId() + ","
+ student.getFirstName() + "','" + student.getLastName()
+ "','" + student.getEmail() + "','" + student.getPhone()
+ "')";

try {
    // get connection to db
    con = new CreateConnection().getConnection("checkjdbc", "root",
        "root");

    // get a statement to execute query
    stmt = con.createStatement();

    // executed insert query
    stmt.execute(query);
    System.out.println("Data inserted in table !");
}
```

Regular expression in... Java

DSL in GPL

```
public class RegexTestStrings {  
    public static final String EXAMPLE_TEST = "This is my small example "  
        + "string which I'm going to " + "use for pattern matching."  
  
    public static void main(String[] args) {  
        System.out.println(EXAMPLE_TEST.matches("\\w.*"));  
        String[] splitString = (EXAMPLE_TEST.split("\\s+"));  
        System.out.println(splitString.length); // Should be 14  
        for (String string : splitString) {  
            System.out.println(string);  
        }  
        // Replace all whitespace with tabs  
        System.out.println(EXAMPLE_TEST.replaceAll("\\s+", "\t"));  
    }  
}
```

Internal DSLs vs External DSL

- Both internal and external DSLs have strengths and weaknesses
 - learning curve,
 - cost of building,
 - programmer familiarity,
 - communication with domain experts,
 - mixing in the host language,
 - strong expressiveness boundary
- Focus of the course
 - **external DSL** a completely separate language with its own custom syntax and tooling support (e.g., editor)

Question to the audience

Find a DSL that is both
internal and external

HTML

- External DSL: <html>....
- Internal DSLs
 - LISP
 - Scala (XML support included in the language)

```
object XMLTest1 extends Application {  
    val page =  
        <html>  
            <head>  
                <title>Hello XHTML world</title>  
            </head>  
            <body>  
                <h1>Hello world</h1>  
                <p><a href="scala-lang.org">Scala</a> talks XHTML</p>  
            </body>  
        </html>;  
    println(page.toString())  
}
```

```

object XMLTest1 extends Application {
  val page =
<html>
  <head>
    <title>Hello XHTML world</title>
  </head>
  <body>
    <h1>Hello world</h1>
    <p><a href="scala-lang.org">Scala</a> talks XHTML</p>
  </body>
</html>;
  println(page.toString())
}

```

Scala

```

1 // Import the Glitter DSL
2 import glitter._
3
4 object Templates {
5
6   // Define a reusable layout
7   def layout(body: Xml) =
8     html5dtd | 'html (
9       'head :: 'title :: "Glitter is amazing!"
10      | 'body :: body
11    )
12
13   // Define a template taking one String argument and using the Layout defined above
14   def show(name: String) =
15     layout (
16       'h1 :: "Show user"
17       | 'p :: ("Hello " | 'strong(name) | "!")
18     )
19
20   // Define a template taking a List of Strings, using the Layout defined above
21   def index(users: List[String]) =
22     layout (
23       'h1 :: "User list"
24       | 'ul % 'class~"user-list" :: (for (user <- users) yield ('li :: user))
25     )
26 }

```

<https://github.com/julienrf/glitter>

```

1 let webpage : HTML = HTMLElement(Dict.empty(), [BodyElement(Dict.empty(),
2   [H1Element(Dict.empty(), [TextNode("Results for " + keyword)]),
3    ULElement((Dict.add Dict.empty() ("id", "results")), to_list_items(query(db,
4      SelectStmt(["title", "snippet"], "products",
5        [WhereClause(InPredicate(StringLit(keyword), "title"))]))))))]
1 let webpage : HTML = <html><body><h1>Results for {keyword}</h1>
2   <ul id="results">{to_list_items(query(db,
3     SELECT title, snippet FROM products WHERE {keyword} in title))}
4   </ul></body></html>
1 let webpage : HTML = parse_html("<html><body><h1>Results for "+keyword+"</h1>
2   <ul id=\"results\">" + to_string(to_list_items(query(db, parse_sql(
3     "SELECT title, snippet FROM products WHERE '"+keyword+"' in title")))) +
4   "</ul></body></html>")

```

SQL

Plain SQL
(external DSL)

shape
#1

```
1 |-- SQL
2 SELECT * FROM journal
3   WHERE published_year = 2013
4     AND publisher = 'IEEE'
5 ORDER BY title
```

Java
(internal DSL)

shape
#2

```
// JOOQ fluent API
ResultQuery q = create.selectFrom(JOURNAL)
    .where(PUBLISHED_YEAR.equal(2013)
        .and(PUBLISHER.equal("IEEE")))
    .orderBy(TITLE);
```

Scala
(internal DSL)

shape
#3

```
journals
  .filter(journal => journal.published_year === 2013
    & journal.publisher === "IEEE")
  .sortBy(_.title)
```

Homework

Homework

- Jhipster (<http://www.jhipster.tech/>), let us consider the “last” version (September 16, 2018)

How many languages are used in such a contemporary project?

1. List all software languages used in Jhipster
2. Classify them (GPL? External DSL? Internal DSL?)

Don't forget APIs that look like (internal) DSLs

<http://tinyurl.com/jhipster-langs1819>

(deadline: next course)

Plan

- Domain-Specific Languages (DSLs)
 - Languages and abstraction gap
 - Examples and rationale
 - DSLs vs General purpose languages, taxonomy
- **External DSLs**
 - Grammar and parsing
 - Xtext
- DSLs, DSMLs, and (meta-)modeling

Contract

- Better understanding/source of inspiration of software languages and DSLs
 - Revisit of history and existing languages
- Foundations and practice of Xtext
 - State-of-the-art language workbench (Most Innovative Eclipse Project in 2010, mature and used in a variety of industries)
- Models and Languages
 - Perhaps a more concrete way to see models, metamodels and MDE (IDM in french)
